Introduction

Fortuna Lebens-Versicherungs AG, Vaduz (hereinafter called LFL) is falling under the scope of Solvency II Directive reporting and is required to predispose its own Solvency and Financial Condition Report (SFCR).

This is in accordance with the Directive 2009/138/EC ('Solvency II Directive') as well as with the Delegated Regulation 2015/35/EC ('Delegated Act') and related Guidelines.

The objective of the Solvency and Financial Condition Report (SFCR) is to increase transparency in the insurance market requiring insurance and reinsurance undertakings to disclose publicly, at least on an annual basis, a report on their solvency and financial condition.

LFL has prepared its Solvency and Financial Condition Report (SFCR) in line with the requirements for public disclosure under the Solvency II regulatory regime and the Generali Supervisory Reporting and Public Disclosure Group Policy, which was issued by the Generali Group and was also adopted by LFL.

Following these requirements this report was approved by Board of Directors of LFL on 03.04.2020.

Reference date of the reporting is 31.12.2019, covering the reporting period between 01.01.2019 and 31.12.2019.

Reporting currency is CHF.

As part of the solvency and financial condition report the following quantitative templates are disclosed:

- (a) template S.02.01 of Annex I specifying balance sheet information using the valuation in accordance with Article 75 of Directive 2009/138/EC, following the instructions set out in section S.02.01 of Annex II to this Regulation;
- (b) template S.05.01 of Annex I, specifying information on premiums, claims and expenses using the valuation and recognition principles used in the undertaking's financial statements, following the instructions set out in section S.05.01 of Annex II to this Regulation, for each line of business as defined in Annex I of Delegated Regulation (EU) 2015/35;
- (c) template S.05.02 of Annex I, specifying information on premiums, claims and expenses by country using the valuation and recognition principles used in the undertaking's financial statements, following the instructions set out in section S.05.02 of Annex II;
- (d) template S.12.01 of Annex I, specifying information on the technical provisions relating to life insurance and health insurance pursued on a similar technical basis to that of life insurance ('health SLT') for each line of business as defined in Annex I to Delegated Regulation (EU) 2015/35, following the instructions set out in section S.12.01 of Annex II to this Regulation;
- (e) template S.22.01 of Annex I, specifying information on the impact of the long term guarantee and transitional measures, following the instructions set out in section S.22.01 of Annex II of Delegated Regulation (EU) 2015/35;
- (f) template S.23.01 of Annex I, specifying information on own funds, including basic own funds and ancillary own funds, following the instructions set out in section S.23.01 of Annex II of Delegated Regulation (EU) 2015/35;
- (g) template S.25.01 of Annex I, specifying information on the Solvency Capital Requirement calculated using the standard formula, following the instructions set out in section S.25.01 of Annex II of Delegated Regulation (EU) 2015/35;
- (h) template S.28.01 of Annex I, specifying the Minimum Capital Requirement for insurance and reinsurance undertakings engaged in only life or only non-life insurance or reinsurance activity, following the instructions set out in section S.28.01 of Annex II of Delegated Regulation (EU) 2015/35.

Glossary & Abbreviations

AMSB: Administrative, Management and Supervisory Board; for LFL synonym with BoD

Best estimate liability: The best estimate liability represents the expected present value of future cash flows related to insurance and reinsurance obligations in force at valuation date. The best estimate liability is calculated on a gross of reinsurance basis, i.e. without any deduction of the amounts recoverable from reinsurance contracts and special purpose vehicles.

Best estimate operating assumptions: The assumptions on all those non-financial factors which can have an impact on future cash-flows, including not only the most common operating factors (i.e. mortality/longevity, disability/morbidity, lapses, expenses), but also those contractual policyholders' options that can be exercised by policyholders at pre-determined conditions (e.g. annuity take-up rates, voluntary premium increases, maturity extensions...).

BoD: Board of Directors

BSCR: Basic Solvency Capital Requirement according to Standard Formula; equals the SCR before adjustments to consider loss absorbing capacity of profit sharing of life insurance contracts and deferred taxes and before aggregation with the capital requirements for operational risks.

Cash and cash equivalents: this asset class includes money in the physical form, cash equivalents, bank deposits and other money deposits.

CMP: Capital Management Policy

Contract boundaries: This is the limit beyond which possible cash flows are excluded from the calculation of technical provisions. It is defined in line with Article 18 of the Delegated Acts, which states that:

"Obligations which relate to insurance or reinsurance cover provided by the undertaking after any of the following dates do not belong to the contract, unless the undertaking can compel the policyholder to pay the premium for those obligations:

- a) the future date where the insurance or reinsurance undertaking has a unilateral right to terminate the contract;
- b) the future date where the insurance or reinsurance undertaking has a unilateral right to reject premiums payable under the contract;
- c) future date where the insurance or reinsurance undertaking has a unilateral right to amend the premiums or the benefits payable under the contract in such a way that the premiums fully reflect the risks."

Counterparty default risk adjustment: The counterparty default adjustment is the amount of reinsurance recoverables that the Company expects not to be able to recover as a consequence of the possible default of the reinsurance counterparty at any point in time in the future.

EEA: European Economic Area

Fixed income instruments: direct investments in government and corporate bonds, mortgage and loans.

FRR: Financial Reporting Risk

Generali Group: Global Group of Generali at Corporate Level with GHO in Trieste

GS: Generali Switzerland

GHO: Generali Head Office in Trieste

Gross written premiums (GWP): Equal to gross written premiums of direct business and accepted by third parties.

Gross direct premiums (GDP): Equal to gross written premiums of direct business.

Investments back to unit and index-linked policies: includes various types of investments backing insurance liabilities related to unit and index-linked policies

LFL: short name used in the report for the reporting company Fortuna Lebens-Versicherungs AG, Vaduz

Long term guarantee adjustments and transitional measures: This expression refers to the matching adjustment (as set out in article 77b of Solvency II Directive), the volatility adjustment (as set out in article 77d of Solvency II Directive), the transitional measure on the risk-free interest rates (as set out in article 308c of Solvency II Directive) and the transitional measure on technical provisions (as set out in article 308d of Solvency II Directive).

Matching adjustment: it refers to an adjustment applicable on top of the risk free rate curve. The application of such an adjustment is subject to prior supervisory approval and to strict requirements on the related portfolio of assets and liabilities. In particular, this adjustment can be applied for the valuation of matched business, i.e. in case of business where asset cash flows match (in terms of timing and amounts) liability cash flows. The calculation of the adjustment reflects the spread over the risk free rate of the assigned portfolio of assets, after a deduction for default and downgrade.

Minimum Capital Requirement (MCR): The Minimum Capital Requirement corresponds to an amount of eligible basic own funds below which policyholders and beneficiaries are exposed to an unacceptable level of risk were insurance and reinsurance undertakings allowed to continue their operations. It corresponds to the Value-at-Risk of the basic own funds subject to a confidence level of 85% over a one-year period (Solvency II Directive 2009/138/CE, Art. 129).

Net cash inflows: it is an indicator of cash flows generation of the life segment. It is equal to the amount of premiums collected net of benefits paid.

Other investments: includes participations in non-consolidated Group companies, derivative investments and receivables from banks and customers, the latter mainly related to Group banking operations.

Outstanding Claims Reserves: The Outstanding Claims Reserves (or Claims Provisions) are reserves for the outstanding claims, whether reported or not, occurred before the evaluation date whose costs and related expenses have not been completely paid by that date.

Reinsurance recoverables: Reinsurance recoverables represent the amount of best estimate liability expected to be recovered via reinsurance treaties or special purpose reinsurance vehicles and correspond to the expected present value of the future cash flows referring to the in force reinsurance agreements.

Return on investments: it is an indicator of both life segment and property and casualty segment, calculated as the ratio between the result and the average investments calculated based on the balance sheet values.

Risk Adjusted Capital (RAC): The Risk Adjusted Capital is defined as the one-year change in basic own funds calculated at various percentiles (e.g. 1-in-10, 1-in-200). It is derived by reading the points from the full Probability Distribution Forecast (PDF) of the one-year changes in own funds, generated by the Partial Internal Model.

Risk Appetite Framework (RAF): The Risk Appetite Framework sets the overall risk strategy in terms of aggregate level of risk that the company is willing to accept or avoid in order to achieve its business objectives.

Risk margin: The risk margin is the part of technical provisions that should ensure that the overall value of the technical provisions is equivalent to the amount a third party would theoretically require in order to take over and meet the insurance liabilities, taking into account the cost of capital required to support those liabilities over their remaining future lifetime and regarding non-hedgeable risks such as underwriting and operational risks.

Solvency II ratio: defined as the ratio between the Eligible Own Funds and the Group Solvency Capital requirement, both calculated according to the definitions of the SII regime. Own funds are determined net of proposed dividend. The ratio has to be intended as preliminary since the definitive Regulatory Solvency Ratio will be submitted to the supervisory authority in accordance with the timing provided by the Solvency II regulations for the official reporting.

Solvency Capital Requirement (SCR): The Solvency Capital Requirement is determined as the economic capital to be held by insurance and reinsurance undertakings in order to ensure that ruin occurs no more often than once in every 200 cases or, alternatively, that those undertakings will still be in a position, with a probability of at least 99.5%, to meet their obligations to policyholders and beneficiaries over the following 12 months (Solvency II Directive 2009/138/CE, Introduction, c. 64).

Technical provisions: The technical provisions correspond to the algebraic sum of the best estimate liability and risk margin. In case technical provisions are considered on a net of reinsurance basis, the amount of reinsurance recoverables after counterparty default adjustment is deducted from the technical provisions.

Executive Summary

BUSINESS AND PERFORMANCE (SECTION A)

The present report is published in accordance with the Solvency II Regulatory framework and discloses detailed quantitative and qualitative information about the solvency and financial condition of the company for the reporting year 2019.

LFL is a life insurance company based in Vaduz. The company is owned by Generali (Schweiz) Holding and is embedded within the globally acting Generali Group with its Head Office in Trieste, Italy.

LFL stopped its new business production in 2015 and the insurance portfolio has been in run-off ever since. Up to 2015, LFL carried out its business under the principle of "Freedom to provide services", mainly in EEA countries and in Switzerland. The insurance portfolio is dominated by savings and annuity products, mainly in the unit-linked business.

In 2019, gross premiums written decreased by 12% due to the run-off situation of the portfolio and the depreciation of the euro against the Swiss franc. LFL reported a loss of CHF 10.7 million for 2019, which is the result from the one-off strengthening of the technical provisions. Technical provisions for interest rate risk were increased by CHF 14 million to CHF 25.3 million in 2019 because of the further decline of the interest rates. The good performance of capital markets, in particular of stock markets, led to an improved investment result in 2019 compared to the previous reporting period.

SYSTEM OF GOVERNANCE (SECTION B)

LFL relies on a sound risk management system including governance and structured risk management processes. It is the set of rules, procedures and structures that ensure the effective operation of the company and enable it to identify, measure, manage, control, and report the main risks to which it is exposed. To ensure a consistent framework, LFL has adopted the Generali Group Directives on the System of Governance, complemented by Group Risk Policies. The internal control and risk management system is founded on the establishment of the three lines of defense:

- Operating Functions (the "risk owners"), which represent the first line of defense and have ultimate responsibility for risks relating to their area of expertise;
- Actuarial, Compliance and Risk Management Functions, which represent the second line of defense;
- Internal Audit, which represents the third line of defense.

RISK PROFILE (SECTION C)

LFL is mainly exposed to market, life underwriting, credit and operational risks. The nature of these risks and the overall risk profile description are provided in Section C.

LFL measures its risks by means of the Solvency II Standard Formula (SF) for market, life underwriting risks and credit risks. Operational risks are also measured by means of the Standard Formula, complemented by qualitative risk assessments. The SF provides an adequate representation of the main risks to which LFL is exposed, measuring not only the impact of each risk taken individually but also their combined impact on the LFL's own funds.

For the other risks, not measured by the SF, qualitative risk assessments are performed, which showed no material risks for LFL in 2019.

VALUATION FOR SOLVENCY PURPOSES (SECTION D)

Under Solvency II, the balance sheet of the company is valued based on an economic, market-consistent approach as required by the Solvency II regulatory framework. Section D includes a complete overview of the valuation of the Solvency II assets and liabilities, by disclosing qualitative and quantitative information for all differences between SII and statutory valuation.

In particular, assets and liabilities other than technical provisions are recognized in compliance with IFRS standards, where applicable, also taking into account the specific Solvency II requirements for some balance sheet items, where IFRS standards cannot be applied.

Technical Provisions under Solvency II are calculated as the sum of the best estimate of liabilities net of reinsurance plus risk margin and amount to 677 CHF millions at YE2019 (YE2018: 606 CHF millions). The difference between the statutory reserves and Solvency II Life Technical Provisions is due to substantial methodological differences between the two valuation approaches. The evaluation of the SII Life Technical Provisions depends not only on the methods, models, and data used, but also on the assumptions on a number of economic and operational factors whose future realizations might differ from the expectations at the valuation date. The significant methods and assumptions used in this calculation are detailed in chapter D2.

CAPITAL MANAGEMENT (SECTION E)

Capital management activities aim to establish common guiding principles and standards for carrying out management and control procedures of own funds in accordance with the relevant regulatory requirements and legislative frameworks, and in line with the level of risk appetite of LFL.

The capital position at YE2019 is presented in Section E, which provides a detailed overview of the structure of Own Funds, as well as the components related to Solvency Capital Requirements (SCR). At YE2019, LFL's eligible Own Funds are all categorized as Tier 1 corresponding to YE2018. The SCR and Minimum Capital Requirement (MCR) coverage are both on an adequate level. The SCR coverage improved from 119.1 % at YE2018 to 158.2 % at YE2019.

A. Business and Performance

A.1. BUSINESS

A.1.1. GENERAL INFORMATION

Fortuna Lebens-Versicherungs AG (LFL), located in Vaduz, Principality of Liechtenstein, belongs to the Generali Group Switzerland (GGS), through which LFL is part of the globally operating Generali Group with its Head Office (GHO) in Trieste. The shares of LFL are 100% owned by Generali (Schweiz) Holding AG. Generali (Schweiz) Holding AG is a 100% owned subsidiary of Generali Group under the leadership of Assicurazioni Generali S.p.A., located in Trieste, Italy. LFL was founded in 1996 and started its business operation in spring 1997.

LFL is supervised by the Liechtenstein Financial Market Supervisory Authority (FMA)¹, Vaduz, Liechtenstein, and audited by Ernst & Young², Zurich, Switzerland.

Responsible for the financial supervision of the Generali Group conglomerate to which LFL belongs is the Italian Supervisory Authority IVASS³ (Istituto per la Vigilanza sulle Assicurazioni), Rome, Italy.

LFL is a life insurance company in run-off. Until 2015, LFL acted under the principle of “Freedom to provide services” for life insurance within the liberalization of the European insurance-market. LFL carried out its business mainly in EEA countries and in Switzerland and is specialized in unit-linked insurance business and traditional insurance products with profit participation. The product portfolio in both lines of business is mainly dominated by savings products (endowment or capitalization insurance) and annuity products. In unit-linked business, the products were offered with or without guarantees with the possibility for the inclusion of supplementary insurances (premium waiver and disability rider). Insurance contracts are mainly based on CHF or EUR, and to a lower extent on USD, as a contract currency.

In unit-linked insurance business, savings premiums are invested according to the customer’s choice from a set of unit-linked investment plans with different investment strategies.

A.1.2. OVERALL PERFORMANCE

Profit and Loss Account		in TCHF	
Local GAAP	2019	2018	Change in %
Technical Result (Underwriting Performance)	-9'011	8'134	
Investment Result (Investment Performance)	-1'292	-2'302	-44%
RESULT BEFORE TAXES	-10'303	5'832	%
Taxes	-441	-783	-44%
Total Net Result	-10'743	5'049	

The loss of CHF 10.7 million reported for 2019 results from the one-off strengthening of the technical provisions for interest rate risks. This reserve was increased by CHF 14 million to CHF 25.3 million in 2019. The reason for this increase was the significant decline in interest rates (especially EURO swap rates), which is the basis for determining the adequacy of the insurance provisions. The good performance of capital markets, in particular of stock markets, led to an improved investment result in 2019 compared to the previous reporting period.

The underwriting performance and the investment performance are described in more detail in the following sections A.2 and A.3.

A.1.3. OTHER RELEVANT INFORMATION

As of July 2014, LFL stopped selling life insurance products in countries outside Switzerland/Liechtenstein and as of March 2015, new business was completely stopped and LFL has been in "Run-Off" since this point of time.

A.2. UNDERWRITING PERFORMANCE

A.2.1. UNDERWRITING PERFORMANCE BY LINE OF BUSINESS

Premiums, claims and expenses by line of business							in TCHF

Net	9'635	36'217	45'852	11'872	36'082	47'955	
Changes in other technical provisions*							
Gross	-13'487	-67'255	-80'742	585	43'386	43'971	
Reinsurers' share							
Net	-13'487	-67'005	-80'492	585	43'386	43'971	
Expenses Incurred	351	4'745	5'096	408	8'892	9'300	
Other expenses			1'278			2'363	
Total expenses			6'374			11'664	

*sign convention for changes in other technical provisions: positive sign: decrease in provisions (=income) / negative sign: increase in provisions (=expense)

In terms of Gross Written Premiums (GWP), 98% of the business is underwritten in the unit-linked insurance, 2% in the insurance with profit participation. 54% of the premium income is deriving from capitalization insurance policies, 37% from endowment and 8% from life annuity insurance contracts. The proportion of pure risk insurance policies is around 1% of the total premium income. This product mix remained unchanged in the reporting period compared to the previous year (PY).

The amount of GWP reported in 2019 is 12% below 2018 due to the run-off status of the insurance portfolio and the depreciation of the EUR against CHF.

Claims incurred of 45.9 CHF millions in the reporting period are below PY, due to the minor outflows mainly deriving from the surrenders (19 CHF millions in 2019 vs. 25 CHF millions in 2018) partially offset by the higher payments from the maturities (22 CHF millions in 2019 vs. 19 CHF millions in 2018).

Change in other technical provisions of the index/unit-linked insurance as well as the insurance with profit participation denoted an increase in the reporting year. The growth in the index/unit-linked portfolio is mainly a result of the positive development of the financial markets, in particular the stock markets. The increase in the technical provisions of the not-linked business is a consequence of the drop in interest rates, which required the strengthening of the provisions in the reporting year.

The decrease in expenses in 2019 compared to the previous year goes hand in hand with the decrease of the managed insurance portfolio. Furthermore, fewer one-off costs were incurred in 2019.

Other expenses refer to cancellations of premiums due to lapses, which relate to premiums written in previous years.

The technical margin of the insurance business amounts to -3.6 CHF millions in 2019 (PY 17.1 CHF millions). The technical margin is mainly the profit margin out of premium income, claims incurred and change in technical provisions, and the fees profit margins from investment fund of the unit linked business. The strong decrease of this margin in 2019 compared to the PY were driven by the strengthening of the technical provisions for interest rate risks. This reserve was increased by CHF 14 million to CHF 25.3 million in the reporting year with effect on technical margin. The reason for this increase was the significant decline in interest rates (especially EURO swap rates), which is the basis for determining the adequacy of the insurance provisions.

After deduction of the expenses related to the technical component of the business the Technical Result of the reporting period amounts to -9.0 CHF millions (PY 8.1 CHF millions).

Profit and Loss Account

* sign convention for change in other technical provisions: positive sign: decrease in provisions (=income) / negative sign: increase in provisions (=expense)

In terms of Gross Written Premiums (GWP) the top 5 countries are: 23% of the life insurance obligations are deriving from policyholders resident in France, each 22% in Switzerland, 21% in Germany, 13% in Austria and 10% in Finland. Within the single countries no significant distinctions of the Business-Mix and underwriting performance are detectable.

Based on the higher average seniority of the insurance portfolio in Germany, Switzerland and Austria compared to the other countries (in particularly to France or Finland), the run-off of the portfolio is mainly evident in this countries. As a result maturities paid are significantly higher than in other countries

A.3. INVESTMENT PERFORMANCE

A.3.1. INVESTMENT RESULT

Profit and Loss per Asset Class		in TCHF	
Local GAAP in TCHF	YE2019	YE2018	Change in %
Investment Result (Investment Performance)	-1'292	-2'302	
Investment Result Traditional Business	-1'259	-1'564	
Investment Result Traditional Business Gross of PH Participation	2'143	1'946	10%
Net Investment Income Bonds	2'096	2'177	-4%
Net Investment Income Loans	83	83	0%
Net Investment Income Collective Investments Undertakings	1'197	-857	
Net Investment Income Derivatives	-587	1'176	
Net Investment Income Cash	86	40	116%
Investment Management Expenses	-732	-673	9%
Policyholder Share of Total Investment income Not Linked Business	-3'403	-3'511	-3%
Investment Result Unit-Linked Business	-33	-737	
Investment Result Unit-Linked Business Gross of PH Share	72'508	-38'405	
Policyholder Share of Total Investment income Unit-Linked	-72'541	37'667	

The Investment Result Gross of Policyholder Participation amounts to 2.1 CHF millions for the traditional and to +72.5 CHF millions for the unit-linked business. The investment income of both business lines was above PY because of the positive performance of the capital markets in 2019.

The current income from the bond portfolio and from the bonds funds (Collective Investments) as well as the realized gains from the equity portfolio were the main source of income in the investment result of the traditional business. In addition, the positive development of the assets value is the main factor for the better result in the reporting period compared to previous year. The hedge of the equity portfolio leads to a loss on derivatives.

As a result of the good development of the capital markets in 2019 the investment result of the Unit Linked Business performed well in the reporting year. This result is shared with the policyholder.

Net of policyholder shares and investment management expenses the Investment Performance of the reporting period results in a loss in the amount of -1.3 CHF millions (2018: -2.3 CHF millions).

A.3.2. GAINS AND LOSSES RECOGNIZED IN EQUITY

In the statutory accounts, according to Liechtenstein generally accepted accounting principles (local GAAP), no gains and losses are recognized in equity and no other comprehensive income accounts are recycled within the equity. The equity is only composed of share capital, retained earnings and net earnings of the current year.

A.3.3. INVESTEMENTS IN SECURITISATION

There are no investments in securitization in the LFL investment portfolio.

A.4. PERFORMANCE OF OTHER ACTIVITIES

There are no material income and expenses from any other activities than already reported in sections A.2. and A.3.

LFL does not have any leasing arrangements.

A.5. ANY OTHER INFORMATION

INFORMATION ABOUT CORONAVIRUS – COVID 19

Pursuant to the EIOPA-BoS-20/236 Recommendation of 20 March 2020 on COVID 19, it should be noted that in the wider context of the economic and financial framework characterized by uncertainty and high volatility linked to the effects of COVID-19, the Company has activated mechanisms for monitoring the solvency position on an ongoing basis, for the purpose of timely analysis the evolution of the situation and the implementation of consequent actions, where necessary.

Furthermore in collaboration with the parent company - Generali Schweiz – Fortuna has promptly implemented a series of initiatives to ensure business continuity and to protect the health of its employee and its stakeholder.

In a context of greater uncertainty and volatility, especially in respect of the financial markets, due to the COVID 19 pandemic, the Shareholder decided at the end of the first quarter 2020 to further strengthen the Company's capital position with a capital contribution of CHF 8 million ("Einlage in die Kapitalreserven", according to art. 1068 of the Liechtenstein Persons and Companies Act [PGR]) in order to better protect the Solvency of the Company in the given context of great volatility and uncertainty.

B. System of Governance

B.1. GENERAL INFORMATION ON THE SYSTEM OF GOVERNANCE

B.1.1. INFORMATION ON GOVERNANCE

LFL's shareholder, Generali Switzerland Holding AG (GSH), has assigned the management of LFL to the Board of Directors and the Delegate of the Board of Directors of LFL (according to Art. 180 of the Liechtenstein Law on Persons and Companies [PGR] and the Organizational Regulations of LFL). The delegate of the BoD is, thus, responsible for LFL's management and is supported by the General Manager and the deputy General Manager.

Organizationally, LFL is part of GS and functionally integrated into the Business Unit Life & Pension. In this context, the General Manager also reports to the Chief Life & Pension Officer (Bernhard Locher), who currently also act as LFL's Chairman of the BoD. The Chief Life & Pension Officer acts as Delegate of the BoD. The composition of LFL's BoD and the Executive Committee as of 31 December 2019 is shown below:

The Risk Governance shall ensure an effective organization with clearly defined key risk roles and responsibilities and a set of policies.

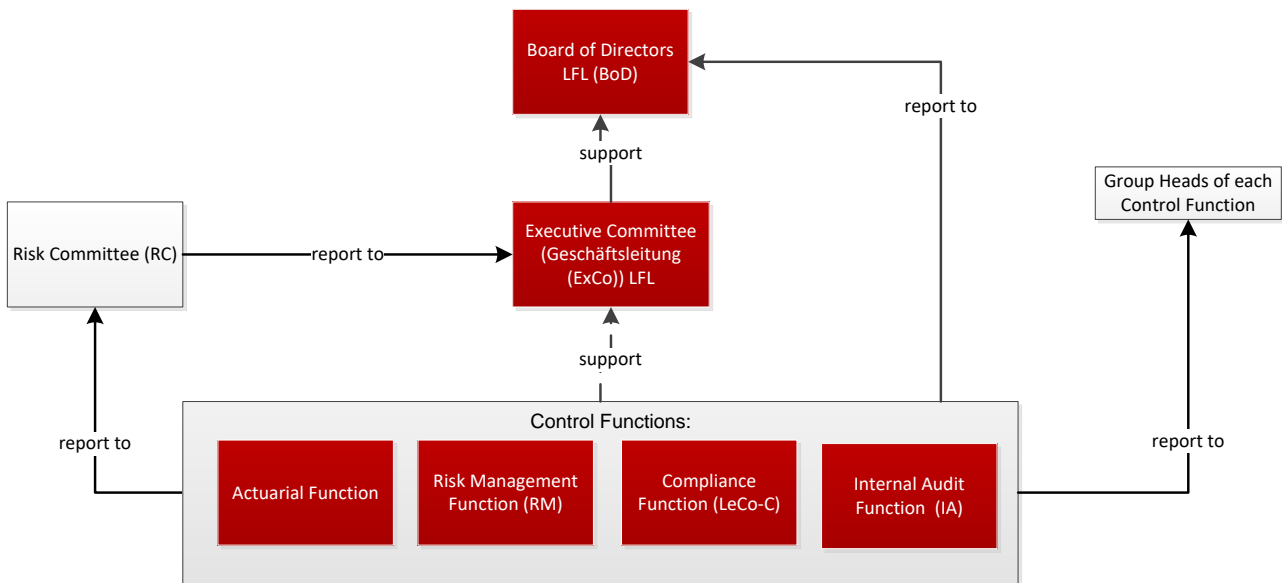

The key risk roles and responsibilities for LFL are the following:

Key Risk Role	Description
Board of Directors (BoD)	The BoD ensures that the most significant risks for LFL are identified, evaluated and managed. Ultimately, the BoD is responsible for the implementation, adequacy and sustainability of LFL's risk management strategy and control framework in terms of completeness, functioning and effectiveness.
Executive Committee (ExCo)	The ExCo is responsible for the operative implementation, maintenance and monitoring of LFL's risk and control framework.
Risk Owners	The Heads of the Operating Units are the so-called Risk Owners. They regularly identify, analyze and control the risks relating to their processes. The Operating Units perform these risk management activities in cooperation with GPV's Enterprise Risk Management (ERM) and Compliance function.

During the reporting period, the Shareholder made two capital contributions to strengthen LFL's equity ("Einlage in die Kapitalreserven", according to art. 1068 of the Liechtenstein Persons and Companies Act [PGR]). The first injection amounted to CHF 25 million and the second to CHF 12 million (see section E.1). The company has also concluded a reinsurance agreement (Lapse Risk Stop Loss Reinsurance Agreement) with Assicurazioni Generali S.p.A. to cover part of the lapse risks (see sections C.1.1 and E.1). There were no

other material transactions during the reporting period with shareholders or persons who exercise a significant influence on LFL (incl. LFL's BoD members).

The following organizational chart shows the reporting lines of LFL's control functions (Risk Management, Compliance, Actuarial Function and Internal Audit) as of 31 December 2019:

For a comprehensive description of key roles and responsibilities of the control functions please refer to the “Group Directives on the System of Governance” and the “Risk Management Group Policy”.

In section B.1.4 more details are disclosed for the relevant control functions (Risk Management, Compliance, Internal Audit and Actuarial Function) as well as for the BoD and Risk Committee.

B.1.2. CHANGES IN THE SYSTEM OF GOVERNANCE

The Board of Directors was expanded in 2019 with FMA's approval of Dr. Alexander Lacher as additional member of LFL's BoD on 17 January 2019.

B.1.3. REMUNERATION POLICY

The GS Remuneration Committee is formed by a representative of the shareholder together with representatives from GHO. The Committee convenes whenever business requires, but at least once a year.

The GS Remuneration Committee determines the remuneration of the CEO and the members of the Executive Committee and in particular the Head Internal Audit, Chief Risk Officer, Compliance Officer and Head Legal & Compliance.

Remuneration Principles

The Reward Strategy for GS includes the following key elements:

- Ensurement of a clear and relevant target setting process within a balanced score card framework along the SMART objectives guidelines
- A focus on total compensation (base salary, bonus and value of long-term incentives) with variable payout depending on the individual performance
- A total remuneration package which is competitive in relation to comparable organizations in the Swiss Insurance Industry
- Equity and consistency of remuneration in relation to the assigned responsibilities and demonstrated capabilities
- Alignment with the corporate strategy and targets

- A consistent compliance with our “Equal Pay” principle
- Value merit and performance in terms of results, behaviors and values
- Clear governance and compliance with the regulatory framework (IVASS 39 Regulation)

Remuneration Philosophy

In managing the remuneration of employees, the following objectives are pursued:

- Providing a competitive total remuneration package in both cash and non-cash components for talent attraction and retention
- Rewarding the people in a fair and consistent way, in line with GHO reward philosophy and the local market practices
- Ensuring internal and external equity for the reward system
- Promoting pay-for-performance culture and differentiating reward based on performance and competences.

B.1.4. INFORMATION ON CONTROL FUNCTIONS

For the organizational chart showing integration and reporting lines for the relevant control functions (Risk Management, Compliance, Internal Audit and Actuarial Function) please refer to section B.1.1.

The risk and control functions of LFL are outsourced to GPV and operate according to the “Three Line of Defense” approach:

- 1.) The Operating Units are the First Line of Defense and have ultimate responsibility for risks concerning their area;
- 2.) The Risk Management, Actuarial, and the Compliance function form the Second Line of Defense;
- 3.) The Internal Audit function is the Third Line of Defense.

Control Functions	Description
Risk Management Function (RM)	The RM function consists of the Quantitative Risk Management (QRM) and Enterprise Risk Management (ERM). QRM is responsible for the calculation of the risk capital according to Solvency II, including the ORSA-Report. ERM implements and monitors the Risk Management System and supports the Risk Owners in the identification and assessment of risks and key controls. RM is in constant dialogue with the Heads of the Operating Units and reports to the Risk Committee (RC), where the risk profile and risk management of the LFL are presented and discussed. The RC advises and supports the Executive Committees (ExCo) and Boards of Directors (BoD) of GS including LFL in respect of the target risk definition and the respective level of economic capital. Moreover, it helps to monitor the risk profile (based on reports prepared by RM) and develop mitigation strategies.
Compliance Function	The Compliance function is part of GPV’s Legal and Compliance Department and is responsible for the identification, evaluation and prevention of risks derived from failures to comply with external and internal regulations. The Compliance function supports GS’s legal entities and employees in observing/complying with the relevant laws, regulations, internal policies and Generali’s ethical standards.
Internal Audit Function	GPV’s Internal Audit function is responsible for independent audits and assessments of the effectiveness of the LFL’s Governance, risk and control framework as well as business processes using a systematic and goal-oriented audit approach. The Internal Audit function performs audits within both, the first and the second line of defense.
Actuarial Function	The Actuarial function is responsible for the adequacy of technical provisions.

Annex B lists all regulations relating to the System of Governance of the company.

B.1.5. INDEPENDENCE AND QUALIFICATIONS OF THE CONTROL FUNCTIONS

The independence requirements, responsibilities, duties and authorities of the control functions (Risk Management, Compliance, Internal Audit and Actuarial Function) are defined in respective policies. The respective policies are mentioned in Annex B.

As all the control functions are outsourced to GPV (as part of GS), LFL benefits from diversified teams within the independent functions. There are overall more than 30 employees having mostly multiple years of experience in the control functions in GPV, several years of

experience in Solvency II topics and relevant qualifications related to their functions. LFL as part of GS and part of an international insurance group as Generali Group can also benefit from knowledge and support through cross border connected functions.

B.2. FIT AND PROPER REQUIREMENTS

B.2.1. SKILLS, KNOWLEDGE AND EXPERTISE REQUIRED FOR KEY FUNCTIONS

For its key functions, LFL's BoD has implemented a Fit & Proper Group Policy (along with relevant procedures) in line with Generali's group-wide standards and Solvency II requirements.

"Fitness" includes general and specific qualifications, knowledge, experience and understanding related to LFL's business (including actuarial and financial analyses, governance, the regulatory framework and the market environment). Collectively, the qualification, knowledge and experience of LFL's key functions must be adequate at all times. This will ensure sound and prudent management.

Knowledge of LFL's environment requires awareness and understanding of a wide array of relevant aspects, including the macro- and microeconomic environment, and customer-related matters. Understanding LFL's business also includes its strategy and operating model as well as the ability to read and understand the firm's actuarial and financial information, to identify, assess, and address risks and potential issues. In addition, LFL's key functions must be able to assess the effectiveness of the company's arrangements and to implement adequate governance, oversight and controls. Last but not least, the awareness for and understanding of LFL's regulatory environment is required in order to effectively deal with legal and regulatory changes.

B.2.2. PROCESS FOR ASSESSING FITNESS AND PROPERNESS

LFL's Fit & Proper Group Policy requires regular fit & proper checks of its key personnel. These checks are provided by the relevant personnel and/or by the person or body appointing the relevant personnel. Fitness evaluation shall assess the person's professional qualification, knowledge and experience for the respective role. Properness checks assess whether the personal and business conduct of the relevant personnel is adequate for its function.

B.3. RISK MANAGEMENT SYSTEM INCLUDING THE OWN RISK AND SOLVENCY ASSESSMENT

B.3.1. RISK MANAGEMENT SYSTEM

The purpose of the Risk Management System is to ensure that all risks to which LFL is exposed are properly and effectively managed on the basis of the risk strategy defined, following a set of processes and procedures and based on clear governance provisions.

The principles defining the Risk Management System are provided in the Risk Management Group Policy, which is the cornerstone of all risk-related policies and guidelines.

The Risk Management Group Policy covers all risks to which LFL is exposed on a current basis or on forward-looking basis.

Generali Group's Risk Management process is defined on the following phases:

1. Risk identification

The purpose of the Risk identification phase is to ensure that all material risks to which LFL is exposed are properly identified. For that purpose, the Risk Management Function interacts with the main Risk Owners in order to identify the main risks, assess their importance and ensure that adequate measures are taken to mitigate them according to a sound governance process.

Based on Solvency II risk categories and for the purpose of Solvency Capital Requirement (SCR) calculation, risks are categorized according to the following Risk Map corresponding to the EIOPA Standard Formula. Relevant risk modules for LFL are Market Risk, Credit Risks/ Counterparty Default Risk, Life Underwriting Risk and Operational Risk.

Risk Map

Risks covered by SCR (Standard Formula)					
BSCR (Standard Formula)					Standard Formula
Market Risks	Counterparty Default Risk	Non-Life Underwriting Risk	Life Underwriting Risk	Health Risk	Operational Risk
Interest Rate		Premium & Reserve	Mortality		
Equity		Non-Life Lapse	Longevity		
Property		CAT	Disability/ Morbidity		
Spread			Life Lapse		
Currency			Expenses		
Concentration			Revision		
			CAT		

LFL has also developed an effective Risk Management System for those risks, which are not included in the SCR calculation, such as Liquidity Risk and Other Risks (so called 'non-quantifiable risks', i.e. Reputational Risk, Contagion Risk and Emerging Risks).

2. Risk measurement

The risks identified during the 1st phase are then measured through their contributions to the SCR, eventually complemented by other modelling techniques deemed appropriate and proportionate to better reflect the risk profile of LFL. Using the same metric for measuring the risks and the SCR ensures that each risk is covered by an adequate amount of Solvency Capital, which could absorb the loss incurred, if the risk went to materialize.

In compliance with Solvency II regulation, the SCR is calculated based on the EIOPA Standard Formula.

Risks not included in the SCR calculation, such as Liquidity Risk and the Other Risks are evaluated based on other quantitative and qualitative techniques / models.

3. Risk Management and control

As part of Generali Group, LFL operates under a sound Risk Management System in line with the processes and the strategy set by Generali Group. To ensure that the risks are managed according to the risk strategy, LFL follows the governance defined in the Group Risk Appetite Framework (RAF). RAF governance provides a framework for risk management embedding in day-to-day and extraordinary business operations, control mechanisms as well as escalation and reporting processes.

The purpose of the RAF is to set the desired level of risk (in terms of Risk Appetite and Risk Preferences) and limit excessive risk-taking. Tolerance Levels on the basis of capital and liquidity metrics are set accordingly. Should an indicator approach or breach the defined Tolerance Levels, escalation mechanisms are then activated.

4. Risk reporting

Risk monitoring and reporting is a key Risk Management process, which allows maintaining Risk Owners, ExCo, BoD and also the Supervisory Authority aware and informed on the risk profile development, risk trends and breaches of Risk Tolerances.

The Own Risk and Solvency Assessment (ORSA) is the main risk reporting process, coordinated by the Risk Management Function. Its purpose is to provide the assessment of risks and of the overall solvency needs on a current and forward-looking basis. The ORSA process ensures ongoing assessment of the solvency position in line with the Strategic Plan and Capital Management Plan, followed by a regular communication of ORSA results to the Supervisory Authority after BoD approval. In case of negative developments of the solvency position / risk profile corresponding measures are proposed by the control functions and discussed with the BoD. More details are provided in section B.3.3.

Risk governance

The above Risk Management process is ensured by the Risk Management Function, which in compliance with Solvency II and the principles set in the Risk Policies, supports the BoD and the ExCo in ensuring the effectiveness of the Risk Management System. The Risk Management Function is responsible for reporting to the BoD the most significant risks identified and for coordinating the ORSA process. The Risk Management Function has the responsibility to:

- Assist the Administrative, Management or Supervisory Board (AMSB, corresponding to BoD) and other functions in the effective operation of the Risk Management System;
- Monitor the Risk Management System and the implementation of the Risk Management Group Policy;
- Monitor the general risk profile of LFL and coordinate the risk reporting, including the reporting in case of tolerances breaches;
- Advise BoD and support main business decision-making processes including those related to strategic affairs such as corporate strategy, mergers and acquisitions and major projects and investments.

For the organizational chart of the relevant control functions including Risk Management, please refer to section B 1.1.

B.3.2. ORSA PROCESS

The ORSA process is a key component of the Risk Management system, which aims at assessing the adequacy of the solvency position and the risk profile on a current and forward-looking basis.

The CRO (Chief Risk Officer) is responsible for the preparation of the ORSA Report and is supported by the GHO CRO in terms of methodological support, process definition and reporting templates. The GHO process is cross referenced in all companies' processes and consistent with Strategic Planning process.

The ORSA Report is produced on an annual basis. In addition to the annual ORSA Report, non-regular ORSA Reports are produced when the risk profile has changed significantly. Key deliverables of the ORSA Process are highlighted in the figure.

All results are properly documented in the ORSA Report and discussed within the Risk Committee. After discussion and approval by the BoD, the Report is submitted to the Liechtenstein Supervisory Authority FMA. As a general rule, the information included in the ORSA Report is sufficiently detailed in order to ensure that the relevant results can be used in the decision-making process and in the business planning process.

The results of the local ORSA are also reported to the GHO as an input to the ORSA process of GHO. For this reason, LFL follows the principles set in the Risk Management Group Policy and additional operating procedures (e.g. ORSA Reporting Group Guideline). These are issued by GHO to grant consistency of the ORSA process across the companies of GHO.

B.3.3. RISK EMBEDDING IN CAPITAL MANAGEMENT PROCESS

The Capital Management Group Policy was adopted by LFL and approved by the BoD.

Capital Management and Risk Management are strongly integrated processes. This integration is deemed essential to ensure alignment between business and risk strategies.

By means of the ORSA process the projection of capital position and the forward-looking risk profile assessment contribute to the Strategic Planning and Capital Management process.

The ORSA Report also leverages on the Capital Management Plan to verify the adequacy, including the quality, of the Eligible Own Funds to cover the overall solvency needs on the basis of the plan assumptions.

B.4. INTERNAL CONTROL SYSTEM

B.4.1. DESCRIPTION OF THE INTERNAL CONTROL SYSTEM

The requirements concerning the Internal Control System are defined in the Group Directives on the System of Governance (see B1.1). The Group Directives on the System of Governance was adopted by LFL and approved by the BoD.

The Internal Control System (ICS) of the legal insurance entities of GS including LFL is based on the COSO⁴ framework and consists of:

- Process Components:
 - Entity-wide processes
 - Business processes
- Control Components:
 - Entity Level Controls
 - IT General Controls (ITGC)
 - IT Application Controls (ITAC)
 - Manual Controls
- Operational Risk Components as listed in section C.5.1, including also:
 - Financial Reporting Risk (FRR)
 - IT Risks
 - Compliance Risks
- Reporting: To the BoD / Audit and Risk Committee (if established, not relevant for LFL)
- Documentation in Policies und Guideline
- The documentation of business processes including key controls is risk-oriented and archived in a GRC-IT-Tool provided and maintained by GHO

In 2019 the ICS Function is included in the second line of defense (Risk Management Function and Compliance Function).

For business processes shared within GS also covering LFL (like for example accounting processes) the respective key controls are submitted to regular control testing by either the 1st line of defense (Management Testing), the 2nd line of defense (Independent Testing by ERM/ Compliance Function) or GHO's FRR Testing.

The Solvency II regulation requires insurance undertakings to have internal processes and procedures in place to ensure the appropriateness, completeness and accuracy of the data used in Standard Formula and in the calculation of the Technical Provisions.

In order to comply with the Data Quality requirements, LFL implemented an appropriate process for monitoring the Data Quality for the calculation of the Standard Formula SCR and the Technical Provisions, based on the GHO Data Quality Framework.

Concerning further information on Operational Risk please refer to section C.5.

As a major risk mitigation action concerning business contingency the companies of GS have an adequate Business Continuity Management System and Disaster Back-up in place.

B.4.2. IMPLEMENTATION OF THE INTERNAL CONTROL FUNCTION

In 2019 the ICS Function is included in the second line of defense (Risk Management Function and Compliance Function). For the organizational structure and decision making process of these functions, please refer to sections B.1.1 and B.1.4.

B.5. INTERNAL AUDIT FUNCTION

⁴ Committee of Sponsoring Organizations of the Treadway Commission; <https://www.coso.org>

B.5.1. INFORMATION ON INTERNAL AUDIT FUNCTION

The Internal Audit Function is an independent, effective and objective function established by the BoD to examine and evaluate the adequacy, functioning, effectiveness and efficiency of the internal control system and all other elements of the system of governance, with a view of improving the efficacy and efficiency of the internal control system, of the organization and of the governance processes.

The Internal Audit function supports the BoD in identifying the strategies and guidelines on internal control and risk management, ensuring they are appropriate and valid over time and provides the BoD with analysis, appraisals and recommendations concerning the activities reviewed. The Internal Audit function also carries out advisory activities for the benefit of the BoD.

Organizational structure and the decision making processes of the undertaking

The Internal Audit function of the companies of Generali Switzerland (GS) is attached legally to Generali Personenversicherungen AG. The other companies within the GS Group, including LFL, are audited by the same audit function based on outsourcing agreements. This assures that the necessary resources and skills are available to adequately cover all relevant business areas within the businesses.

At the same time, the Internal Audit function of GS forms part of Group Audit of GHO.

Based on this model, the Head of the Internal Audit Function reports to the BoD of LFL. In addition, a solid line reporting model is established between the Head of Group Audit, the regional Head and the Head of the Internal Audit Function of GS.

This ensures autonomy to act and independence from operational management as well as more effective communication flows. The solid reporting line covers the methodologies to be used, the organizational structure to be adopted (recruiting, appointment, dismissal, remuneration and budget in agreement with the BoD), the objectives setting and the year-end appraisal, the reporting methods, as well as the proposed audit activities to be included in the Internal Audit Plan to be submitted to the BoD of LFL for approval.

B.5.2. INDEPENDENCE, OBJECTIVITY AND QUALIFICATIONS OF INTERNAL AUDIT FUNCTION

The Internal Audit Function has full, free, unrestricted and timely access to any and all of the organization's records, physical properties, and appropriate personnel to carry out any engagement, with strict accountability for confidentiality and safeguarding records and information. The Head of the Internal Audit Function also has free and unrestricted access to the BoD. All employees are required to assist the Internal Audit Function in fulfilling its roles and responsibilities. Top Managers have the responsibility to promptly inform the Head of the Internal Audit Function of any major potential or actual control failures.

The Internal Audit Function of GS governs itself by adherence to the Institute of Internal Auditors' mandatory guidance including the definition of Internal Auditing, the Code of Ethics, and the International Standards for the Professional Practice of Internal Auditing. Given the delicate and important nature of the assurance role carried out within the business, all the personnel of the Internal Audit Function must have specific fit & proper requirements as requested by the Fit & Proper Group Policy.

Resources are aligned with the requirements defined in the yearly planning process. The hiring and dismissals of key auditors throughout the GS is coordinated with the Group Audit. As of 31 December 2019, the audit team comprised 7 persons (31 December 2018 seven persons), including the Head of Internal Audit.

In particular, the Head of Internal Audit Function is a person, who meets the requirements of the local Regulation Authority's regime and Solvency II Regulation as well as the Generali Group requirements. She has solid relevant experience within areas like audit, control, insurance, finance, risk or in the auditing of financial statements.

Also the other personnel belonging to the Internal Audit Function has the necessary skills and a proven track record commensurate with the degree of complexity of the activities to be carried out.

The Internal Audit Function is an independent, effective and objective function to examine and evaluate the adequacy, functioning, effectiveness and efficiency of the ICS and all other elements of the system of governance, with a view of improving the efficacy and efficiency of the ICS, of the organization and of the governance processes.

The activity of Internal Audit remains free from interference by any element in the organization. To this effect, Internal Auditors do not have direct operational responsibility or authority over any of the activities audited.

B.6. ACTUARIAL FUNCTION

The main responsibilities of LFL's Actuarial Function, as required by the Solvency II principles (article 48 of Directive 2009/138/EC), are the following:

- coordinate the calculation and validate the Solvency II technical provisions;
- inform the Board of Directors of LFL on the reliability and adequacy of the calculation of the Technical Provisions;
- express an opinion on the overall Underwriting Policy;
- express an opinion on the adequacy of the reinsurance arrangements;
- contribute to the effective implementation of the Risk Management System.

In line with the organizational model defined by GHO, the Actuarial Function is located under the CFO area to ensure an effective coordination for the calculation of technical provisions. In addition, to preserve the independence in carrying out his activities, the head of Actuarial Function functionally reports to the Board of Directors, to which he has independent and direct access.

In addition to the head of the function, one person is dedicated to the coordination of the activities (methodology, reporting, processes), while another person is specifically dedicated to the independent validation of the technical provisions in Solvency II.

B.7. OUTSOURCING

B.7.1. INFORMATION ON OUTSOURCING POLICY

The Group Outsourcing Policy is intended to set consistent minimum mandatory outsourcing standards at Group level, assign main outsourcing responsibilities and ensure that appropriate controls and governance structures are established within any outsourcing arrangement.

The Policy applies to all Group legal entities, outlining the main principles to be followed when implementing outsourcing.

The Policy introduces a risk-based approach, adopting a proportionality principle to apply requirements according to the risk profile (distinguishing between critical and not critical outsourcing), the materiality of each outsourcing agreement and the extent which Generali Group controls the service providers.

The Policy requires the appointment, for each outsourcing agreement, of a specific business referent. The business referent is responsible for the overall execution of the outsourcing lifecycle, from the risk assessment to the final management of the agreement and subsequent monitoring activities of the Service Level Agreements defined in each contract.

The Group Outsourcing Policy was adopted by LFL and approved by the BoD.

Executive Committee (ExCo) of LFL approved an adopted version of the GS Outsourcing Policy ("Weisung über die vertragliche Auslagerung von Aktivitäten und/oder Funktionen"), which is based on the Group Outsourcing Policy.

B.7.2. OUTSOURCING ARRANGEMENTS

LFL has made use of the option to delegate the functions listed below within the GS respectively within Generali Group (group of companies, which are directly or indirectly affiliates of Assicurazioni Generali S.p.A.). The service providers of the mentioned functions are resident in Switzerland with the exception of the service provider, who is responsible for investment of assets and portfolio management (Investment Function), which is resident in Italy.

Critical Functions:

- Internal Audit (Key Function)
- Finance (incl. Actuarial Function) (Key Function)
- Risk Management (Key Function)
- Legal & Compliance (Key Function)
- Informatics
- Customer Service
- Life & Pension, Product Pricing (Actuarial Service)
- Claims
- Investment (Assets Management Agreement as well as Advisory and Investment Management Agreement)

Other Functions:

- Product management
- Claims special services
- Human Resources
- Logistics
- Sales Partner Support

B.8. ANY OTHER INFORMATION

The ORSA process resulted in no major issues and no action is required. There is no evidence that the System of Governance is not adequate.

C. Risk Profile

C.1. UNDERWRITING RISK

C.1.1. LIFE UNDERWRITING RISK

THE RISK EXPOSURE AND ASSESSMENT

The portfolio of LFL consists of unit-linked insurance with or without guarantees and traditional life insurance. There are mainly endowment, capitalization and annuity products, which can be sold together with premium waiver and disability rider (only for Swiss customers). LFL does not have any health business.

Life Underwriting Risks include Biometric and Operating Risks embedded in the Life insurance policies. Biometric Risks derive from the uncertainty in the assumptions regarding mortality, longevity, health, morbidity and disability rates taken into account in the insurance liability valuations. Operating Risks derive from the uncertainty regarding the amount of expenses and from the adverse exercise by the policyholders of their contractual options. Along with the premium payment, the lapse of the policy is the most significant contractual option held by the policyholders.

The Life Underwriting Risks identified in the Risk Map are:

- Mortality Risk, defined as the risk of loss, or of adverse change in the value of insurance liabilities, resulting from changes in the mortality rates, where an increase in the mortality rates leads to an increase in the value of insurance liabilities. Mortality Risk include also Mortality Catastrophe Risk, as the risk of loss, or of adverse change in the value of insurance liabilities, resulting from the significant uncertainty of pricing and provisioning assumptions related to extreme or irregular events;
- Longevity Risk that, similarly to Mortality, is defined as the risk resulting from changes in the mortality rates, where a decrease in the mortality rate leads to an increase in the value of insurance liabilities;
- Disability and Morbidity Risks are defined as the risk of loss, or of adverse change in the value of insurance liabilities, resulting from changes in the disability, sickness, morbidity and recovery rates;
- Lapse Risk is linked to the loss or adverse change in liabilities due to a change in the expected exercise rates of policyholder options. The relevant options are all legal or contractual policyholder rights to fully or partly terminate, surrender, decrease, restrict or suspend insurance cover or permit the insurance policy to lapse. This includes also the catastrophic event on lapse;
- Expense Risk, as the risk of loss, or of adverse change in the value of insurance liabilities, resulting from changes in the expenses incurred in servicing insurance or reinsurance contracts;

The main Underwriting Risks in LFL's portfolio are Lapse and Expense Risks. LFL's portfolio has a prevailing component of saving business that is exposed to Lapse Risk and also includes some annuity portfolios, with the presence of Longevity Risk. Finally, Expense Risk is present in all the products in the portfolio. As the portfolio is in run-off there is no significant change of the risk profile during the reporting period.

The approach underlying the Life Underwriting Risk measurement is based on the calculation of the loss for LFL resulting from unexpected changes in biometric/operating assumptions. In particular, the capital requirements for Life Underwriting Risks are calculated on the basis of the difference between the Solvency II (SII) Technical Provisions after the application of a stress to the biometric/operating assumptions and the SII Technical Provisions under best-estimate expected conditions.

The Life Underwriting Risks are measured through a quantitative model aimed at determining the Solvency Capital Requirement (SCR), based on the methodology and parameters defined in the SII Standard Formula approach.

The risk measurement derives from the application of a pre-defined stress to the best estimate biometric/operating assumptions with a probability of occurrence equal to 0.5%.

For Mortality and Longevity Risks, the uncertainty in insured population mortality and its impact on LFL are measured applying permanent and catastrophe stresses to the policyholders' death rates.

For Morbidity and Disability Risks, the uncertainty in insured population sickness or morbidity and its impact on LFL are measured applying permanent or catastrophe stresses to the policyholders' morbidity, disability and recovery rates.

In case of Lapse Risk, risk calibration and loss modelling aims at measuring the uncertainty in policyholder behavior with respect to legal or contractual options that give them the rights to fully or partly terminate, surrender, decrease, restrict or suspend insurance cover or permit the insurance policy to lapse. Similarly to Biometric Risks, the measurement is done via the application of permanent and catastrophe stresses to these policyholders behavior.

Expense Risk is measured through the application of stresses to the amount of expenses and expense inflation that LFL expects to incur in the future.

For quantitative information about the breakdown of the SCR by risk module, please refer to the table *Total SCR split by Risk* in the section E.2.2.

No changes in risk measurement occurred over the reporting period.

RISK MANAGEMENT AND MITIGATION

Since LFL is in run-off and does not underwrite any new business anymore, no specific risk management or risk mitigation actions are required related to the pricing, product approval or underwriting processes.

For the existing business, a reinsurance program is in place covering underwriting death and disability risks of the insurance portfolio by a surplus reinsurance treaty. Starting from YE19 a new stop loss reinsurance treaty is in place covering part of the lapse risk. The reinsurance program is subject to the Life Actuarial Function opinion regarding its risk mitigation efficiency and adequacy in accordance with the GHO Group Actuarial Function Policy and related guidelines.

C.1.2. NON-LIFE UNDERWRITING RISK

Non-Life Underwriting Risk is not applicable for LFL.

C.2. MARKET RISK

C.2.1. RISK EXPOSURE AND ASSESSMENT

As a life insurer, LFL collects premiums from policyholders in exchange of payment promises contingent on pre-determined events.

For the investment of the savings premium of the unit-linked business the customer can choose from unit-linked investment plans, which in case of unit-linked with guarantee are defined by LFL. For unit-linked without guarantees LFL holds no Market Risk. For the traditional business LFL invests the collected premiums in a wide variety of financial assets, with the purpose of honoring future promises to policyholders and generating value for its shareholders.

LFL is then exposed to the following Market Risks, that:

- Invested assets do not perform as expected because of falling or volatile market prices;
- Cash of maturing bonds are reinvested at unfavorable market conditions, typically lower interest rates.

Nevertheless, LFL is required by the Solvency II regulation to hold a capital buffer, with the purpose of maintaining a sound solvency position even in the circumstances of adverse market movements. For quantitative information, please refer to section E.2.

For this purpose, LFL manages its traditional investments in a prudent way according to the so-called 'Prudent Person Principle', and strives to optimize the return of its assets while minimizing the negative impact of short term market fluctuations on its solvency.

The Market Risks included in the Risk Map are:

- Interest Rate Risk is defined as the risk of adverse changes in the market value of the assets or in the value of liabilities due to changes in the level of interest rates in the market. LFL is mostly exposed to downward changes in interest rates as lower interest rates increase the present value of the promises made to policyholders more than the value of the assets backing those promises. As a result it may become increasingly expensive for the Company to maintain its promises thereby also leading to financial losses;
- Interest Rate Volatility Risk is defined as the risk of adverse changes in the market value of the assets or the value of liabilities due to changes in the level of interest rate implied volatilities. This comes for example from insurance products sold with embedded

minimum interest rate guarantees, the market consistent value of which is sensitive to the level of interest rates volatility. The SII Standard Formula does not cover the Interest Rate Volatility Risk. Analyses show no major impact for LFL;

- Equity Risk is defined as the risk of adverse changes in the market value of the assets or in the value of liabilities due to changes in the level of equity market prices, which can lead to financial losses. Exposure to Equity Risk arises from positions that are sensitive to equity prices, e.g. shares that LFL has invested in or embedded derivatives in a Life product that invests parts of the policyholder assets in equity;
- Equity Volatility Risk is defined as the risk of adverse changes in the market value of the assets or in the value of liabilities due to changes in the volatility of equity markets. Exposure to Equity Volatility Risk arises from asset or liability positions that have embedded equity options. The SII Standard Formula does not cover the Equity Volatility Risk. Analyses show no major impact for LFL;
- Property Risk is defined as the possibility of adverse changes in the market value of the assets or the value of liabilities due to changes in the level of property market prices. Exposure to Property Risk arises from property asset positions.
- Currency Risk is defined as the possibility of adverse changes in the market value of the assets or the value of liabilities due to changes in exchange rates. Exposure to Currency Risk arises from direct or indirect asset or liability positions that are sensitive to changes in exchange rates;
- Concentration Risk is defined as the risk of incurring in significant financial losses because the asset portfolio is concentrated to a small number of counterparties, thus increasing the possibility that a negative event hitting only a small number or even a single counterparty can produce large losses;

Common risk measurement methodologies (both qualitative and quantitative) are applied in order to provide an integrated measurement of the risks borne by LFL.

For the evaluation of its Market Risks, LFL makes use of the SII Standard Formula, as ruled by the Solvency II Directive, complemented by additional measurement techniques deemed appropriate and proportionate. Under the SII Standard Formula the Spread Risk is aggregated in the Market Risk module, see section C 3.1.

Market Risk concentration is explicitly modelled by the Standard Formula. Based on the results of the model and on the composition of the balance sheet LFL has a small Concentration Risk.

Based on this methodology, the breakdown of the SCR originating from Market Risks indicates that Currency Risk and Equity Risk are the most relevant Market Risks for LFL.

For quantitative information about the breakdown of the SCR by risk module, please refer to the table *Total SCR split by Risk* in the section E.2.2.

The methodology used to evaluate the Market Risks is unchanged, with respect to the previous reporting period.

C.2.2. RISK MANAGEMENT AND MITIGATION

The Market Risks borne by LFL are managed in different ways:

- The aim of the Strategic Asset Allocation process is to define the most efficient combination of asset classes which, according to the 'Prudent Person Principle' set out in the Solvency II Directive and related relevant implementation measures, maximizes the investment contribution to value creation, taking into account solvency, actuarial and accounting indicators.
- The annual SAA proposal defines target exposure and limits, in term of minimum and maximum exposure allowed, for each relevant asset class.
- In addition to risk tolerance limits set on LFL solvency position defined within the Risk Appetite Framework, the current risk monitoring process of LFL is also integrated by the application of the Investment Risk Group Guidelines (IRGG) provided by GHO.
- The IRGG include general principles, quantitative risk limits (with a strong focus on credit and market concentration), authorization processes and prohibitions.
- In 2019 LFL purchased equity puts to mitigate the equity risk.

C.3. CREDIT RISK

C.3.1. RISK EXPOSURE AND ASSESSMENT

As a life insurer, LFL collects premiums from policyholders in exchange of payment promises contingent on pre-determined events.

For the investment of the savings premium of the unit-linked business the customer can choose from unit-linked investment plans which in case of unit-linked with guarantee are defined by LFL. For the traditional business LFL invests the collected premiums in a wide variety of financial assets, with the purpose of honoring future promises to policyholders and generating value for its shareholders.

Some of these financial investments are subject to the following Credit Risks, that:

- Invested assets do not perform as expected because of perceived or actual deterioration of the credit worthiness of the issuer;
- Derivative or reinsurance contracts do not perform as expected because of perceived or actual deterioration of the credit worthiness of the counterparty.

Nevertheless, LFL is required by the Solvency II regulation to hold a capital buffer, with the purpose of maintaining a sound solvency position even in the circumstances of adverse market movements. For quantitative information, please refer to section E.2.

For this purpose, LFL manages its investments in a prudent way according to the so-called 'Prudent Person Principle', and strives to optimize the return of its assets while minimizing the negative impact of short term market fluctuations on its solvency position.

The Credit Risks included in the Risk Map are:

- Spread Widening Risk is defined as the risk of adverse changes in the market value of the assets due to changes in the market value of non-defaulted credit assets. The market value of an asset can decrease because of spread widening risk either because the market's assessment of the creditworthiness of the specific obligor decreases, which is typically accompanied by a credit rating downgrade, or because there is a market-wide systemic reduction in the price of credit assets. Under the SII Standard Formula the Spread Widening Risk is aggregated in the Market Risk module;
- Default Risk is defined as the risk of incurring in losses because of the inability of counterparty to honor its financial obligations. Distinct modelling approaches have been implemented to model default risk in the bond portfolio (referred to as Credit Default Risk) and the default risk arising from the default of counterparties in cash deposits, risk mitigation contracts (including reinsurance), and other type of exposures subject to credit risk (referred to as Counterparty Default Risk).

In order to ensure that the level of Credit Risks deriving from the invested assets are adequate to the business run by LFL and to the obligations taken with the policyholders, the investment activity is performed in a sound and prudent manner in accordance with the 'Prudent Person Principle' set out in Article 132 of Directive 2009/138/EC.

The practical implementation of the 'Prudent Person Principle' is applied independently of the fact that assets are subject to Market Risks, Credit Risks or both, so the same principles and processes described in section C.2.2. apply also to the optimization of the portfolio allocation with respect to Credit Risks.

Common risk measurement methodologies (both qualitative and quantitative) are applied in order to provide an integrated measurement of the risks borne by LFL.

For the evaluation of its Credit Risks, LFL makes use of the SII Standard Formula, as ruled by the Solvency II Directive, complemented by additional measurement techniques deemed appropriate and proportionate.

For quantitative information about the breakdown of the SCR by risk module, please refer to the table *Total SCR split by Risk* in the section E.2.2.

The methodology used to evaluate Credit Risks is unchanged with respect to the previous reporting period.

Credit Risk concentration is explicitly modelled by the EIOPA Standard Formula. Based on the results of the model and on the composition of the balance sheet LFL has no material risk concentrations.

C.3.2. RISK MANAGEMENT AND MITIGATION

The Credit Risks borne by LFL are managed in different ways:

- For the unit-linked business, the premium is invested in different investment plans, which in case of business with guarantee are predefined by LFL. The current risk monitoring process of LFL is also integrated by the application of the Investment Risk Group Guidelines (IRGG) provided by the GHO. The IRGG include general principles, quantitative risk limits (with a strong focus on Credit and Market concentration), authorization processes and prohibitions.
- For policy loans, the amounts outstanding, including interest, are either repaid by the customer or the outstanding amount can be fully deducted from the surrender value in case of lapse of the policy or from the benefit payment at the expiry of the policy.

C.4. LIQUIDITY RISK

C.4.1. RISK EXPOSURE AND ASSESSMENT

Liquidity Risk is defined as the uncertainty, emanating from business operations, investment or financing activities, over the ability of the insurer to meet payment obligations in a full and timely manner, in a current or stressed environment. This could include meeting commitments only through a credit market access at unfavourable conditions or through the sale of financial assets incurring in additional costs due to illiquidity of (or difficulties in liquidating) the assets.

LFL is exposed to Liquidity Risk as a result of insurance operating activity due to the potential mismatches between the cash inflows and the cash outflows deriving from the business. Liquidity Risk can additionally stem from investing activity, due to potential liquidity gaps deriving from the management of the LFL's assets portfolio as well as from a potentially insufficient level of liquidity (i.e. capacity of being sold at a fair price in adequate amounts and within a reasonable timeframe) in case of disposal. Finally, LFL can be exposed to liquidity outflows related to issued guarantees, commitments, or regulatory constraints that could impact its capital position.

GHO's Liquidity Risk measurement relies on projecting cash obligations and available cash resources into the future, so as to monitor that available liquid resources are at all times sufficient to cover the cash obligations that will come due in the same period.

GHO has defined a set of medium-term Liquidity Risk Metrics that are used to regularly monitor the liquidity situation of each Group insurance company. All such metrics are forward-looking, i.e. they are calculated at a future date based on projections of cash-flows, assets and liabilities and an estimation of the level of liquidity of the asset portfolio. The ratios are aimed at measuring the ability of LFL to ensure the fulfilment of its regulatory requirement as well as its cash obligations towards customers and other stakeholders.

All defined metrics are calculated under the so-called 'base scenario', in which the values of cash-flows and assets correspond to those projected according to LFL's Strategic Plan. Additionally for one metric a so-called 'stress scenario' is applied, in which the projected cash inflows and outflows as well as the market value of assets are recalculated to take into account circumstances that would adversely impact LFL's liquidity.

Liquidity Risk limits have been defined together with GHO in terms of values of the above-mentioned metrics that LFL cannot exceed. The limit framework is designed to ensure that LFL holds a 'buffer' of liquidity in excess of the amount required to withstand the adverse circumstances depicted in the stress scenario.

LFL's latest liquidity metrics calculated have shown no liquidity gap.

Material Liquidity Risk concentrations could arise from large exposures to individual counterparties or groups. In fact, in case of default or other liquidity issues of a counterparty towards which a significant risk concentration exists, this may negatively affect the value or the liquidity of LFL's investment portfolio and hence its ability to promptly raise cash by selling the portfolio on the market in case of need. GHO has set investment limits that enable LFL to limit risk concentrations taking into consideration a number of dimensions, including asset class, counterparty, credit rating, and geographic area.

As per YE 2019 LFL does not have any external financing corresponding to previous year.

C.4.2. RISK MANAGEMENT AND MITIGATION

In 2019 LFL has managed and mitigated Liquidity Risk in consistency with the framework set in the Group internal regulations. LFL aims at ensuring the capacity to meet its commitments also in case of adverse scenarios, while achieving its profitability objective. To that end, it manages expected cash inflows and outflows so as to maintain a sufficient available cash level to meet the short and medium term

needs and by investing in instruments that can be quickly and easily converted into cash with minimum capital losses. LFL considers the prospected liquidity situation in plausible market conditions as well as under stressed scenarios.

LFL has established clear governance for Liquidity Risk measurement, management, mitigation and reporting in consistency with GHO regulations, including the setting of specific limits and escalation processes in case of limits breach or other liquidity issues.

Investment limits have been imposed to LFL in order to ensure that the share of illiquid assets is kept within a level that does not impair LFL's asset liquidity.

C.4.3. EXPECTED PROFITS INCLUDED IN FUTURE PREMIUMS

The Expected Profits Included in Future Premiums (EPIFP) represent the expected present value of future cash-flows which result from the inclusion in Technical Provisions of premiums relating to existing insurance and reinsurance contracts. These are expected to be received in the future, but that may not be received for any reason, other than because the insured event has occurred, regardless of the legal or contractual rights of the policyholder to discontinue the policy.

The amount of EPIFP for the Life business written by LFL has been calculated in accordance with article 260(2) of the Delegated Acts and amounts to 19.3 CHF millions at YE2019 compared to 26.0 CHF millions at YE2018 (net of reinsurance).

C.5. OPERATIONAL RISK

C.5.1. RISK EXPOSURE AND ASSESSMENT

Operational Risk is the risk of loss arising from inadequate or failed internal processes, personnel or systems, or from external events. Compliance and Financial Reporting Risks fall within this category.

In line with the industry practices, LFL adopted the following classification categories (consistent with GHO's approach):

- Internal fraud defined as the events arising due to intentional acts that are illegally performed by one or more Staff Member, in order to obtain a profit for themselves or for others, resulting in a damage for the Company;
- External fraud defined as the events arising due to fraud, robbery or misappropriation, which involve only external parties with the purpose to obtain a personal profit causing a damage to the Company;
- Employment Practices and Workplace Safety defined as the events arising due to being inconsistent with applicable laws on employment, health and safety, and events that provide compensation to employees;
- Clients, Products and Business Practices defined as the events arising due to failure of the organizations to meet promises made to their clients as a result of unintended circumstances rising from negligent practices;
- Damage to Physical Assets defined as the events arising due to natural/industrial disasters and malicious damage of the Company property;
- Business disruption and system failures defined as the events arising due to system failures, technology breakdown, interruption or dysfunction, including utilities;
- Execution, Delivery and Process Management defined as the events arising due to failed transaction processes, or process management failures in general, or to errors in relationship management with trade counterparties and suppliers. Operational Risk events arising in back office areas fall within this category. These events will often be unintentional and could involve failure to properly document and/or complete business transactions.

Following best industry practices, the framework for Operational Risk Management includes within its main activities the Overall Risk Assessment (ORA) and the Loss Data Collection (LDC):

- The ORA provides a forward-looking view on the risks and requires an analysis of the risks performed jointly with the business owners and the Compliance Function. The ORA provides a high-level evaluation of the forward-looking residual risk exposure of the company;
- The LDC is the process of collection of losses suffered as result of the occurrence of Operational Risk events and provides a backward-looking view of the historical losses suffered due to Operational Risk events.

Moreover, the Generali Group exchanges (since 2015) internal loss data in an anonymized way through the 'Operational Risk data eXchange Association (ORX)', a global association of Operational Risk practitioners and with the participation of the main industry players. The aim is to use the data from the peers to learn from their loss experiences, improving the internal controls and anticipating emerging losses.

Main risks arising from ORA 2019

The ORA approach has been strengthened with the application of the enhancement in the Group methodology, which requires a quantification of each risk according to a frequency/severity approach. The results are then compared with a 5 level scale where the levels are defined by predefined percentages applied to the 3-years average operating result of the company.

The following Operational Risks have been identified to be the top four:

- Failure to comply with laws/ regulations concerning customer data privacy
- Flaws in product development and design
- IT attack with loss or alteration of data
- Incorrect data entry/ transfer

The above mentioned risks embed also the possible issues arising by the current legacy IT landscape and the concentration of effort on some IT resources.

All risks are reported to the Executive Committee and the Board of Directors. Risks above a defined threshold are discussed together with related mitigation actions to ensure that main risks are addressed (e.g. with specific projects) or accepted.

Loss Data Collection

During the reporting period, LFL faced new 16 LDC cases related to the legal litigation for which a provision was already built in 2017.

For the evaluation of its Operational Risk, LFL makes use of the SII Standard Formula, as ruled by the Solvency II Directive.

For quantitative information about the breakdown of the SCR by risk module, please refer to the table Total SCR split by Risk in the section E.2.2.1

C.5.2. RISK MANAGEMENT AND MITIGATION

In order to identify, measure, monitor and mitigate the Operational Risk, ERM was given the mandate to coordinate the Operational Risk program. ERM is supported by the Group Risk Management of GHO. The risks related to non-compliance are monitored by the independent Compliance Function. For a description of these control functions, please refer to section B 1.4.

A series of risk-mitigating measures are undertaken within LFL with the aim to further improve our control environment, reducing risk exposure and reaching a better operational efficiency. The major risk-mitigating measures on operational risks for LFL are described in the written risk strategy.

The Operational Risk situation and the status of the Internal Control System (ICS) are regularly presented and discussed in the Risk Committee by ERM.

C.6. OTHER MATERIAL RISK

As part of the qualitative Risk Management framework, also the following risk categories are considered. The definition of these other risks is as follows:

- Strategic Risk referring to current or forward-looking decline in earnings or business sustainability over time, including the non-capacity to generate adequate return on capital, as a consequence of external changes and/or internal decisions, inadequate decision making or improper contagion risk management as well as inadequate adaptation to market environment;
- Reputational Risk referring to potential losses arising from a deterioration or a negative perception of image of the company in respect to its customers (i.e. due to increasing conflicts with policyholders, poor services and inadequate selling and liquidation practices) as well as to its reputation in respect to other counterparties (i.e. supervisory authority);
- Contagion Risk deriving from problems within one of the Generali Group's legal entities affecting the solvency, economic or financial situation of other legal entities within Generali Switzerland or the Generali Group as a whole;
- Emerging Risk referring to the new risks or evolving risks, difficult to be quantified, and potentially significant, due to internal or external environment changes. These can lead to an increase in the exposure to risks already included in the Risk Map or that may require defining a new risk category.

The performed risk assessments of these other risks highlighted no significant impact on the Risk Profile of LFL in 2019.

C.7. ANY OTHER INFORMATION

To test LFL's solvency position resilience to adverse market conditions or shocks a set of stress test and scenario analyses are performed. These are defined considering unexpected, potentially severe, but plausible events. The outcome, in terms of impact on financial and capital position, prepares LFL to take appropriate management actions if such events occur.

The sensitivity analysis considers simple changes in specific risk drivers (e.g. Interest Rates, equity shock, credit spreads and Interest Rate volatility). Their main purpose is to measure the variability of the Own Funds and Solvency Ratio to variations in specific risk factors. The set chosen aims to provide the assessment of resilience to the most significant risks

In order to verify the adequacy of solvency capital position to the changing of the market conditions, the following main sensitivity analyses have been performed:

Risk Free Rate: interest rate change	+/-50 bps
Credit spread of corporate bonds on Swap	+50 bps
Equity Price fair value change	+/-25%
Ultimate Forward rates	-15 bps

The impacts of the above sensitivities on the Solvency Ratio are shown in the following table:

Sensitivities	in Mio. CHF				
	Eligible Own Funds	Delta Eligible Own Funds	Delta Eligible Own Funds %	Solvency Capital Requirement	Solvency Ratio
Official value	89.9			56.9	158.2%
Risk Free Rate: interest rate change +50 bps	100.1	10.1	11.3%	53.3	187.9%
Risk Free Rate: interest rate change -50 bps	78.5	-11.4	-12.7%	62.0	126.7%
Credit spread of corporate bonds on Swap +50 bps	88.4	-1.5	-1.7%	55.0	160.9%
Equity Price fair value change +25%	110.8	20.9	23.2%	56.7	195.5%
Equity Price fair value change -25%	70.4	-19.6	-21.8%	57.1	123.1%
Ultimate Forward rates -15 bps	89.4	-0.5	-0.5%	56.9	157.3%

LFL has implemented diverse actions in 2019 to increase the Solvency Ratio over the business planning period (sections B.1 and E1 explain the implemented measures).

D. Valuation for Solvency Purposes

GENERAL SOLVENCY II VALUATION FRAMEWORK

The Solvency II (SII) regulatory framework standardizes valuations and measurements of assets and liabilities for the SII balance sheet, largely referring to and in conformity with IFRS principles adopted by the European Commission in accordance with Regulation (EC) No 1606/2002, and requiring an economic, market-consistent approach as set out in Article 75 of the Directive 2009/138/EC.

The main general principles of this approach, as far as they are relevant for LFL, are described and applied by LFL as follows:

In accordance with the provisions of Article 75 of the Directive 2009/138/EC, a fair value measurement approach is applied, taking into consideration the risks that arise from a particular balance sheet item and using assumptions that knowledgeable market participants would use in valuing the asset or the liability.

In accordance with the provisions of Article 9 of the Delegated Regulation (EU) 2015/35, the international accounting standards (IFRS) are applied as the default accounting framework for the recognition/derecognition and the valuation of the assets and liabilities, unless otherwise clearly stated and required by Arts. 8 & 11 – 16 of the Delegated Regulation (EU) 2015/35 and provided that the valuation approach under the IFRS is consistent with the fair value measurement approach as set out in Article 75 of the Directive 2009/138/EC.

In LFL, IFRS financial statements are regularly prepared, as the company is required to report its financial statements under IFRS for Generali Group reporting purposes. Therefore, for asset and liability classes, where LFL uses a valuation approach under IFRS in line with the principles stated above, the fair value of the IFRS Balance Sheet is also used as the fair value in the SII Balance Sheet. For asset and liability classes, where the relevant IFRS does not include or LFL does not apply a fair value approach under IFRS, and no other specific SII valuation approach is required, the fair value is derived from IFRS values by using assumptions, which are deemed to be consistent with Article 75 of the Directive 2009/138/EC and to be proportionate with respect to the nature, scale and complexity inherent in the business of the undertaking.

Based on the explanations above, the general valuation approaches used in LFL for the different asset/liability classes in the SII Balance Sheet are summarized in the following table:

General valuation approach adopted by LFL per asset/liability class

Source of fair value / valuation approach	Asset/Liability class	Reference
Fair values taken from IFRS financial statements	Financial Investments, Employee Benefits	Paragraph D.1., D.3.
Fair values evaluated according to SII valuation specificities (Delegated Regulation (EU) 2015/35, Arts. 8 & 11 – 16)	Technical Provisions (incl. Reinsurance Recoverables), Contingent Liabilities, Deferred tax assets/liabilities, Deferred acquisition costs	Paragraphs D.1., D.2., D.3.
Fair values derived from IFRS financial statements	all other assets/liabilities	Paragraphs D.1., D.3.

The evaluation of the fair values in each of the three approaches is based on the following general basic principles:

Basic valuation principles

- Individual assets and liabilities are valued separately.
- The valuation of the assets and liabilities is based on a going concern assumption.

Fair value measurement approach

The objective of a fair value measurement is to estimate the price at which an orderly transaction to sell the asset or to transfer the liability would take place between knowledgeable market participants at the measurement date under current market conditions.

For the fair valuation of liabilities no adjustment to take account of the own credit standing of the undertaking is made, in accordance with the provisions of Article 75 of the Directive 2009/138/EC.

According to IFRS 13 *Fair Value Measurement*, the definition of a fair value is based on an 'exit price' notion and uses a 'fair value hierarchy' which results in a market-based, rather than entity-specific measurement.

Fair value hierarchy

On the basis of the fair value hierarchy, the following hierarchy of high level principles is applied, when valuing assets and liabilities other than technical provisions:

- Whenever available, quoted market prices are used in active markets for the same assets or liabilities.
- Where the use of quoted market prices for the same assets or liabilities is not possible, quoted market prices in active markets for similar assets and liabilities with adjustments to reflect differences are used.
- If there are no quoted market prices in active markets available, mark-to-model techniques are used.
- Maximum use is made of relevant observable inputs and market inputs, whereas undertaking-specific inputs are reduced to a minimum in order to minimize the use of unobservable inputs.

Following these principles, the highest priority is given to (unadjusted) quoted prices in active markets for identical assets or liabilities and the lowest priority to unobservable inputs.

The fair value hierarchy categorizes the inputs used in valuation techniques into three levels. If the inputs used to measure fair value are categorized into different levels of the fair value hierarchy, the fair value measurement is categorized in its entirety in the level of the lowest level input that is significant to the entire measurement (based on the application of judgment).

- **Level 1 inputs**
Level 1 inputs are unadjusted current quoted prices from ordinary transactions in active markets for identical assets or liabilities that can be accessed at the measurement date.
- **Level 2 inputs**
Level 2 inputs are inputs other than quoted market prices included within Level 1 that are observable for the asset or liability, either directly or indirectly. These inputs include quoted prices for similar assets or liabilities in active markets, quoted prices for identical or similar assets or liabilities in markets that are not active, and other observable market inputs.
- **Level 3 inputs**
Level 3 inputs are unobservable inputs for the asset or liability. Unobservable inputs are used to measure the fair value to the extent that relevant observable inputs are not available, thereby allowing for situations in which there is little, if any, market activity for the asset or liability at the measurement date. Unobservable inputs are developed, using the best information available in the circumstances, which also includes the entity's own data, taking into account all information about market participant assumptions that is reasonably available.

Valuation techniques

The fair value measurement is performed by applying the most appropriate valuation technique with respect to the circumstances and available inputs. The most appropriate valuation technique is the one, for which sufficient data is available to measure fair value, maximizing the use of relevant observable inputs and minimizing the use of unobservable inputs.

The following valuation techniques are used in accordance with Art. 10.7 of the Delegated Regulation (EU) 2015/35:

- **market approach** – uses prices and other relevant information generated by market transactions involving identical or comparable (similar) assets, liabilities, or a group of assets and liabilities (e.g. a business);
- **income approach** – converts future amounts (cash flows or income and expenses) to a single current (discounted) amount, reflecting current market expectations about those future amounts.
- **cost approach or current replacement cost approach** – reflects the amount that would be required currently to replace the service capacity of an asset (current replacement cost);

For further details and explanations regarding the valuation techniques applied for the individual asset or liability classes, please refer to the following paragraphs D.1. *Assets*, D.2. *Technical provisions*, and D.3. *Other liabilities*.

For the SII values of each asset and liability class of the reporting period, please refer to the tables “SII Balance Sheet – Assets” and “SII Balance Sheet – Liabilities” (template S.02.01) in the Annex D at the end of this chapter.

D.1. ASSETS

The following paragraphs aim to describe the value of assets for solvency purposes and for statutory financial statements, the recognition and valuation basis applied as well as the methodology used by LFL for the determination of the SII value.

For their valuation, assets have been aggregated into asset classes which are consistent with the asset classes in the Solvency II Balance Sheet (template S.02.01, → see Annex D), thus ensuring transparency and comparability between the methods used and the amounts recognized.

Compared to the previous year, no changes have been applied to the valuation methodologies for assets or to the aggregation of asset classes, neither for Solvency II nor for Statutory purposes.

D.1.1. VALUATION OF ASSETS FOR SOLVENCY II BALANCE SHEET

In the Solvency II environment, assets are generally measured at fair value in accordance with IFRS principles, applying the framework as described above under the section "General Solvency II Valuation Framework" (→ paragraph D – introduction). As also indicated in the introduction, for some specific items exceptions are required or IFRS valuation methods are excluded. The valuation methods for these specific items are described below in the section "Asset Classes with Solvency II Valuation Specificities", as far as they are relevant for LFL.

In the following sections, an overall description of the SII valuation method for each class of assets is provided, complementary to the general valuation for solvency purposes (→ paragraph D - introduction).

ASSET CLASSES AT FAIR VALUE

For LFL, all asset classes except for Reinsurance Recoverables, Deferred Acquisition Costs, and Deferred Tax Assets, where specific SII valuations apply, have been measured at fair value as follows:

Financial Assets

A market approach is used for the valuation of all financial assets classes based on their fair value hierarchy and the availability of observable inputs. Financial assets in LFL are mostly classified within level 1 of the fair value hierarchy, as quoted market prices are available. This applies for Bonds, Collective Investment Undertakings, and Assets held for index-linked and unit-linked contracts. Derivatives are "Over the counter derivative financial instruments" and are classified within level 2 of the fair value hierarchy, as the inputs used for the pricing can be corroborated by observable market data for the full contractual term of the asset.

For all financial asset classes the fair values in the SII Balance Sheet are taken from the relevant positions of the IFRS Balance Sheet, where the same measurement principles are applied. Under IFRS, LFL measures its financial assets at fair value, based on the classification of the financial asset at "Available for sale" or at "Fair Value through Profit or Loss". Since fair values under IFRS are clean fair values (excluding accrued interests), the fair value transferred to the SII Balance Sheet is the sum of the IFRS fair value plus accrued interest for each financial asset class.

Cash

In LFL, this position only includes cash at bank. Therefore, the fair value is deemed to be equal to the IFRS carrying amount due to close duration and maturity.

Policy Loans

Due to the lack of observable market inputs for the fair valuation of policy loans, a cost approach has been used for the determination of the fair value, by approximating and deriving the fair value from the IFRS amortized cost value, taking into consideration the risks for this specific balance sheet item.

Based on the business rules for policy loans in LFL, the risks associated with the policy loans are considered to be negligible for the following reasons: The amount of a policy loan including outstanding interest payments from the policyholder is limited to a certain percentage (50 – 90%, depending on the tariff) of the cash surrender value of the insurance contract. Therefore, the mathematical reserve of the policy acts as a full collateral for the policy loan. Amounts outstanding under a policy loan, including interests, are either repaid by the customer or the outstanding amount can be fully deducted from the surrender value in case of a lapse of the policy or from the benefit payment at the expiry of the policy.

Therefore, the fair value of the policy loans is deemed to be equal to the IFRS amortized cost value.

Receivables and any other assets

Due to the lack of observable market inputs for the fair valuation of these asset classes, a cost approach has been used for the determination of the fair value, by approximating and deriving the fair value from the IFRS amortized cost value, taking into consideration the risks for this specific balance sheet item.

Thereby, as a general assumption, the SII fair value is expected to be equal to the IFRS cost value due to close duration and maturity and to the absence of expected interest cash-flows. Furthermore, regarding to the specific types of receivables recognized in the Balance Sheet, the counterparty default risk is estimated to be negligible. For further details please refer to section D.1.3, where specific explanations are given to the different types of receivables (→ Receivables (R0360/R0380).

ASSET CLASSES WITH SOLVENCY II VALUATION SPECIFICITIES

As mentioned above, the Solvency II regulatory framework (Delegated Regulation (EU) 2015/35, Arts. 8 & 11 – 16) requires some exceptions from general Solvency II valuation principles. In particular, these exceptions for assets, as far as they are relevant for LFL, refer to:

- Reinsurance Recoverables (Art. 8 Delegated Regulation (EU) 2015/35)
- Deferred Acquisition Costs (Art. 12 Delegated Regulation (EU) 2015/35)
- Deferred Tax Assets (Art. 15 Delegated Regulation (EU) 2015/35)

For these asset classes, the following valuation principles have been applied in line with Solvency II requirements:

Reinsurance Recoverables

Reinsurance recoverables are technical provisions from ceded reinsurance contracts and are measured according to the same principles that apply to technical provisions. Reinsurance recoverables under SII are adjusted for the expected losses due to the counterparty default risk. The Solvency II valuation of the technical provisions including reinsurance recoverables is disclosed in the following paragraph D.2. *Technical provisions.*

Deferred acquisition costs

In accordance with the provisions of Art. 12 of Delegated Regulation (EU) 2015/35, goodwill and intangible assets, which include deferred acquisition costs, are to be valued at zero, unless the intangible asset can be sold separately and the insurance and reinsurance undertaking can demonstrate that there is a quoted market price for the same or similar assets. Since there is no quoted market price for deferred acquisition costs or any similar assets, the deferred acquisition costs of LFL have been derecognized in SII balance sheet.

Deferred tax assets (DTA)

SII deferred taxes are based on the difference between the SII value of assets and liabilities and the value for tax purposes on an item by item basis, using the expected tax rate to be applied when assets (liabilities) are realized (settled). Valuation is in line with IAS 12 requirements and is additionally considering SII valuation specificities.

According to the SII framework (Art. 15 of Delegated Regulation (EU) 2015/35), deferred taxes emerge from temporary differences with tax values of assets and liabilities, and, when applicable, from tax losses/credits carry-forwards

DTA is recognized on an item by item basis for those balance sheet items, where the change to SII value is a decrease of the value of an asset item, or an increase of the value of a liability item.

In accordance with the SII framework, the recognition of a deferred tax asset (DTA) is subject to a recoverability test: DTA can only be recognized to the extent that it is probable that future taxable profit will be available against which the DTA can be used, taking into account any legal or regulatory requirements on the time limits relating to the carry-forward of unused tax losses or the carry-forward of unused tax credits.

The table “*Comparison of SII and Statutory Balance Sheet / Assets*” in section D.1.3. shows an overview of the valuation techniques used for each asset class under the SII valuation framework in comparison to the Statutory accounts valuation and provides qualitative and quantitative information on the differences.

D.1.2. STATUTORY VALUATION

For the statutory account valuation, the generally accepted accounting principles of Liechtenstein (local GAAP) have been applied by using the following valuation techniques per individual class of asset:

Financial Instruments

Under local GAAP, the following valuation techniques are used for the valuation of financial instruments:

- Linear Amortized Cost (LAC) – The premium or discount (the difference between the payment and the repayment amounts) is distributed over the term on a linear basis;
- Market approach / market value – uses prices and other relevant information generated by market transactions involving identical or comparable (similar) assets, liabilities, or a group of assets and liabilities;
- Lower of cost or market (LCM) – The lower of the acquisition price or market value is used for valuation.

In the local financial statements of LFL the LAC approach is used for the valuation of the Bonds, and the LCM approach is used for the valuation of the Collective Investment Undertakings and the Derivatives. Assets held for index-linked and unit-linked contracts are valued at market value according to the market approach.

Reinsurance Recoverables

Reinsurance recoverables are valued according to the actuarial specifications for the reinsurance technical provisions without consideration of expected losses due to counterparty default risk.

Deferred acquisition costs

For insurance products, where acquisition costs are not taken into account in the zillmerization of the mathematical provisions, the acquisition costs directly related to the acquisition of new business are deferred and subsequently amortized over a period of five years.

Receivables and any other assets

For receivables and any other assets nominal value is stated in the Statutory Balance Sheet.

The table “*Comparison of SII and Statutory Balance Sheet / Assets*” in section D.1.3. shows an overview of the valuation techniques used for each asset class under the local accounting framework in comparison to the valuation under Solvency II and provides qualitative and quantitative information on the differences. .

D.1.3. DIFFERENCES BETWEEN SOLVENCY II AND STATUTORY BALANCE SHEET

Differences in values between SII and statutory financial statements are generally due to the fact that for specific balance sheet items within the statutory balance sheet valuations different from fair value are used. Please refer to previous sections for a description of the SII valuation (→ paragraph D.1.1.) and the statutory valuation (→ paragraph D.1.2.) approach applied for assets.

The following table shows the main differences for each class of asset between the figures reported in the SII Balance Sheet and those reported in the Statutory Balance Sheet as at 31.12.2019. All differences result from the different valuation principles applied for the SII resp. for the statutory valuation of the assets, as described above. For each class of asset the relevant valuation principles under SII and Statutory Accounts are also indicated in the table and a qualitative explanation for the differences is given after the table.

Comparison of the valuation in Solvency II and Statutory Balance Sheet - Assets

Assets	Ref.	Solvency II (a)		Statutory (b)		Delta (a-b)

Total assets	R0500	789'776		776'715		13'061

EXPLANATION OF MAIN DIFFERENCES PER ASSET CLASS:**Deferred Acquisition costs (R0020)**

As stated in section D.1.1., Deferred acquisition costs are not recognized as an asset under SII valuation principles.

Deferred Tax Assets (R0040)

For calculating the amount of deferred taxes, any difference between the SII value of assets/liabilities and their related carrying value for tax purposes is considered on an item by item basis. As stated in section D.1.1., DTA is recognized for balance sheet items, where the change to SII value is a decrease of the value of the asset item, or an increase of the value of the liability item, resulting in a future taxable loss.

The differences are subject to a deferred tax rate of 12.5 %, which corresponds to the expected average local tax rate for LFL. The same tax rate is also applied for the calculation of deferred taxes in the IFRS reporting of LFL for Generali Group reporting purposes, in line with IAS 12 requirements. The expected average tax rate is evaluated by an external tax expert on a yearly basis. Compared to the previous year, the applicable tax rate remained unchanged.

The recoverability of the carrying amount has been reviewed at balance sheet date, assuming an expiry date of 7 years. Based on this review and due to low materiality, deferred tax assets have been recognized to the entire amount (TCHF 351; YE2018: TCHF 250), since sufficient future taxable profits are expected to be available against which the DTA can be utilized.

No offsetting is made between Deferred Tax Assets and Deferred Tax Liabilities.

DTA are related to the following SII items:

Deferred tax assets related to SII items	in TCHF		
Deferred Tax Assets	Change from Statutory to SII Value	DTA	DTA
<i>Tax rate: 12.5 %</i>	YE2019	YE2019	YE2018
DTA on Reinsurance recoverables (R0270)	743	93	-
DTA on Deferred Acquisition Costs (R0020)	-	-	-
DTA on Contingent Liabilities (R0740)	1'535	192	198
DTA on Pension Benefit Obligations & Payables (R0760/R0840)	528	66	51
Total gross deferred tax assets	2'806	351	250
Offsetting with deferred tax liabilities	-	-	-
Total deferred tax assets in SII Balance Sheet	2'806	351	250

Compared to the previous year, deferred tax assets slightly increased due to a new contingent liability position under SII. For further details, please refer to section D.3.

Investments (other than assets held for index-linked and unit-linked contracts) (R0070)

The change of the SII value compared to the statutory value is due to the different accounting approach. Under SII all financial instruments belonging to this category are measured at fair value, using a market approach, while under statutory accounting a linear amortized cost approach is used for Bonds and a lower cost or market approach is used for Collective Investments Undertakings and Derivatives. As a result, the total change in value for this asset class amounts to TCHF 13'453 (YE2018: TCHF 8'120).

Assets held for index-linked and unit-linked contracts (R0220)

There is no difference between statutory accounts and SII value, since Assets held for index-linked and unit-linked contracts are recognized at fair value by using the same valuation technique under both accounting frameworks.

Policy Loans (R0240)

The change from cost value under statutory accounts to fair value principle under Solvency II does not result in a change of value. For more detail regarding the SII valuation, please refer to the relevant section in paragraph D.1.1.

Reinsurance Recoverables (R0270)

The reinsurance recoverables in the amount of TCHF -495 (YE2018 CHF 0) relate to Life index-linked and unit-linked business.

Receivables (R0360/R0380)

No adjustment is made to the values of receivables, when changing the accounting scheme from nominal value under statutory accounts to fair value measurement under Solvency II.

As stated in paragraph D.1.1, the SII value for receivables is expected to be equal to the nominal value due to close duration and maturity and due to the absence of expected interest cash-flows. The counterparty risk is deemed to be negligible based on the following considerations:

- Insurance and intermediaries receivables (0360) are receivables from outstanding premiums in course of collection, which are completely recoverable according to the General Terms and Conditions of the insurance contract.
- Non insurance receivables (R0380) are intercompany receivables from entities belonging to the Generali Group Switzerland. Therefore, and based on the low materiality of the amount, no credit default adjustment is deemed to be required.

Cash and Cash Equivalents (R0410)

Based on the consideration that this balance sheet item only represents cash at bank, no change to SII value is deemed to be necessary when moving from statutory to SII accounts due to close duration and maturity. Therefore, there is no difference between statutory value and SII value.

Any other assets, not elsewhere shown (R0420)

This residual class of asset items includes prepayments, deferrals and other accrued income. Based on the low materiality and due to the short term nature of these assets as well as the absence of expected interest cash-flows, no adjustment is made when moving from nominal value in statutory accounts to fair value in SII accounts.

D.2. TECHNICAL PROVISIONS

D.2.1. LIFE TECHNICAL PROVISIONS

OVERVIEW OF LIFE TECHNICAL PROVISIONS

The Solvency II Life Technical Provisions at the end of 2019 have been calculated according to articles 77 to 83 of the Directive 2009/138/EC.

The following table shows the amount of Life TP at the end of 2019, split by main components: the best estimate of liabilities, the reinsurance recoverables net of the counterparty default adjustment and the Risk Margin.

SII Life Technical Provisions: split by component	CHF millions	
	YE2019	YE2018
Best estimate of Liabilities - gross of reinsurance	649	581
Risk Margin	27	25
Technical Provisions - gross of reinsurance	676	606
Reinsurance Recoverables	-0	0
Technical Provisions - net of reinsurance	677	606

*** positive signs represent a liability

The best estimate of liabilities corresponds to the average of the present values of expected future cash flows generated from contracts present in the company portfolio, and therefore include both a probabilistic assessment of their occurrence and an appropriate assessment of the time value of money, obtained on the basis of the risk-free interest rates as at 31.12.2019, as observed in the market and officially communicated by EIOPA. This curve (derived, for the main markets, from interbank swap rates) includes both an adjustment to consider the residual default risk of these instruments (the so-called "credit risk adjustment", amounting to -10 bps for Euro and Swiss Franc) and an adjustment to consider the excess return achieved in a risk-free manner by the assets covering the insurance liabilities (the so-called "volatility adjustment", equal to +7 bps in the Euro area and +5 bps for Switzerland).

The method used to derive the best estimate of liabilities is based on a direct approach that involves the projection and discounting of all future expected incoming and outgoing cash flows for the duration of the policyholder's liabilities, in line with the contractual limits defined by regulations (contract boundaries). In particular, the projections consider all future premiums and all outflows associated with both the occurrence of insured events (e.g. claims and capital payable in case of survival of the insured when the contract expires) and the possible exercise of contractual options (for example surrender options).

Depending on the type of portfolio and risk inherent in them, the expected future cash flows have been assessed in a deterministic scenario (i.e. "Certainty equivalent" scenario) or as the mean value of a set of stochastic scenarios, to allow the calculation of the cost of financial guarantees and contractual options. In the latter case, in the actuarial platforms were also implemented specific assumptions on future management decisions (so-called "management actions", relating for example to future profit sharing).

The best estimate of liabilities of a minor part of the portfolio (relating to a product which bears almost no risk due to its not insurance like characteristics) were evaluated using a simplified approach and assumed equal to the IFRS reserves.

As shown in the above table, the best estimate of liabilities gross of reinsurance amounted to 649 CHF millions and entirely refers to direct business.

The risk margin represents an allowance to take account of the inevitable uncertainty linked to the volatility of the operating assumptions and inherent in future cash flows. The risk margin is calculated by means of a cost of capital approach which considers the cost associated with the non-hedgeable risks.

The capital requirement needed to cover the non-hedgeable risk was determined using the SII standard formula. The rate used to determine the cost of capital is 6% per annum. The cost of capital of each projection year was discounted at the valuation date using the term structure of interest rates, without the volatility adjustment. In line with the regulation, the risk margin is calculated net of reinsurance. The future projection of the capital requirement needed to cover the non-hedgeable risks and its allocation by business lines was carried out by means of suitable risk drivers applied to the capital required in respect of each risk included in the calculation of risk margin.

At 31 December 2019, the risk margin associated with LFL life insurance contracts is equal to 27 CHF millions.

In conclusion, the total value of the Solvency II Life Technical Provisions of LFL at 31 December 2019, calculated as the sum of the best estimate of liabilities net of reinsurance and risk margin, amounted to 677 CHF millions (2018: 606 CHF millions).

The following table reports the amount of the Solvency II Life Technical Provisions split by lines of business.

SII Life Technical Provisions: split by Line of Business			CHF millions
YE2019	Statutory reserves	IFRS reserves	Solvency II reserves
Life other than index-linked and unit linked	133	140	137
Index-linked and unit-linked	564	564	539
Health	0	0	0
TOTAL Technical provisions (gross of reinsurance)	697	704	676

*** positive signs represent a liability

LFL Solvency II Life Technical Provisions net of reinsurance mainly consist of direct unit-linked life business with options and guarantees, of direct traditional business and of direct unit-linked business without options and guarantees.

There are no significant changes in assumptions compared to the previous reporting period. Nevertheless there are some minor changes in the best estimate operating assumption factors mortality, morbidity, surrender, paid up rates and expenses. The changes are due to a yearly process of updating the statistics for best estimate operating factor determination.

The new business production has been stopped during 2015, hence the portfolio is in run off.

The following table compares the technical provisions reported in the financial statements with the Solvency II Life Technical Provisions at the end of 2019.

Financial Statement - Solvency II			CHF millions
YE2019	Statutory reserves	Solvency II reserves	Delta
Gross reserves / Best estimate of liabilities gross	697	649	48
Ceded reserves / Reinsurance Recoverables	0	0	0
Risk Margin	0	27	-27
Net reserves / Technical provisions	697	676	21

The difference between the statutory reserves and Solvency II Life Technical Provisions is due to substantial methodological differences between the two approaches making the comparison between the two amounts not informative of the adequacy of the current reserving basis. The Solvency II assessment, in fact, considers the future cash flows projected taking account of best estimate assumptions, future profit sharing (financial and technical) and the financial cost of the guarantees, using as the discount rate the current structure of interest rates. The evaluation of the technical liabilities in the statutory balance sheet, instead, uses the assessments of the technical provisions calculated in accordance with local accounting principles and thus generally uses demographic pricing assumptions, discounts the contractual flows at the technical rate defined at the issue of the contract and, in general, does not consider any future financial profit share on unrealized gains / losses in force at the valuation date.

More specifically, the main differences between the two evaluations are attributable to the following items:

Cash flows resulting from premiums, futures expenses and contractual options:

- Premiums: statutory reserves are usually calculated using pure premiums (i.e. loadings are excluded from the calculation); conversely, in Solvency II valuation, all premiums collected are considered;
- Expenses: typically future costs are excluded from the assessment of statutory reserves or, depending on the type of product, they are measured indirectly by means of the provision of loadings collected in the past (management reserves); on the contrary the Solvency II valuation includes the best estimate of the present value of the costs that will be incurred by the company to fulfil all the contractual obligations;
- Contractual options: typically the calculation of statutory reserves does not consider the probability of exercise by the insured of contractual options such surrenders or failure to pay premiums; conversely, these elements are appropriately considered in Solvency II.

- Operating assumptions: the reserves reported in the statutory financial statements are generally valued using conservative operating assumptions (or first order), and the technical reserves of Solvency II are valued using best estimate assumptions (or second order).
- Economic assumptions: the Solvency II technical provisions are valued using the current economic framework both in terms of interest rate curves and market values of backing assets. In practice, this impacts:
 - projected economic returns and, consequently, future policyholder bonuses included in future cash flows;
 - interest rates used for discounting.
 - On the contrary, financial statement reserves cash flows typically do not consider future policyholder bonuses and are discounted by means of technical interest rates defined at the inception of the contract.
- Methodology used to evaluate the business with profit sharing and guarantees: for this type of contract, the Solvency II technical reserves are valued using stochastic actuarial platforms that capture a wide spectrum of possible financial scenarios and thus allow an explicit assessment of the cost of options and guarantees held by the insured. In contrast, statutory reserves do not include the assessment of that cost.
- Counterparty Default Adjustment: unlike the statutory valuation, the amount of reinsurance recoverables of Solvency II is adjusted to take into account the probability of default of the counterparty.
- Risk Margin: unlike the statutory reserves, Solvency II includes an explicit assessment of the amount to be held against the non-hedgeable risks.

SOURCES OF UNCERTAINTY

The evaluation of the Solvency II Life Technical Provisions depends not only on the methods, models, and data used, but also on the assumptions on a number of economic and operational factors whose future realizations might differ from the expectations at the valuation date.

The underwriting parameters impact LFL portfolio only slightly. However it has to be noted that this is due to diversification effects and changes in lapse rates for sub portfolios only, could have a higher impact. In particular the most relevant operating factor is the lapse risk which affects the unit-linked business with guarantees. A decrease of 10% in the surrender assumptions increases the best estimate of liabilities by about 5 CHF millions. This can be explained by the high guarantees of older tariffs and the current low interest rates environment.

On the other hand, when analyzing the impact on the best estimate of liabilities resulting from possible changes regarding the economic environment in a sensitivity analysis, as shown in section C.7., it was observed that, the technical provisions are sensitive to interest rates and equity capital value movement. Hence a change in one of these economic assumptions can have a material impact on the technical provisions.

LONG-TERM GUARANTEE MEASURES

The valuation of the best estimate of liabilities has been performed using the volatility adjustment (as referred to in Article 77d of the Directive 2014/51/EU) provided by EIOPA for EURO and CHF currency and equal to 7 bps respectively 5 bps at year end 2019 (YE2018: 24bps respectively 4bps). A change to zero of the volatility adjustment would correspond to an increase of 3 CHF millions in the Life Technical Provisions of LFL. The results of the volatility adjustment set to zero on the technical provisions and on the other financial positions including own funds and MCR/SCR are shown in the table *Impact on long term guarantees measures and traditional* (template S.22.01) in Annex E at the end of section E. Capital Management.

The matching adjustment (as referred to in Article 77b of the Directive 2014/51/EU) has not been applied.

The transitional measure on the risk-free interest rate-term structure (as referred to Article 308c of the Directive 2014/51/EU) and the transitional measure on technical provisions (as referred to in Article 308d of the Directive 2014/51/EU) have not been used.

D.3. OTHER LIABILITIES

The following paragraphs aim to describe the value of liabilities other than technical provisions (other liabilities) for solvency purposes and for statutory financial statements, the recognition and valuation basis applied as well as the methodology used by LFL for the determination of the Solvency II value.

For their valuation, the other liabilities have been aggregated into liability classes which are consistent with the liability classes in the Solvency II Balance Sheet (template S.02.01, → see Annex D), thus ensuring transparency and comparability between the methods used and the amounts recognized.

Compared to the previous year, no changes have been applied to the valuation methodologies for other liabilities or to the aggregation of liability classes, neither for Solvency II nor for Statutory purposes.

D.3.1. VALUATION OF OTHER LIABILITIES FOR SOLVENCY II BALANCE SHEET

In the Solvency II environment, other liabilities are generally measured at fair value in accordance with IFRS principles, applying the framework as described above under the section “General Solvency II Valuation Framework” (→ paragraph D – introduction). As also indicated in the introduction, for some specific items exceptions are required or IFRS valuation methods are excluded. The valuation methods for these specific items are described below in the section “Liability Classes with Solvency II Valuation Specificities”, as far as they are relevant for LFL.

In the following sections, an overall description of the SII valuation method for each class of other liabilities is provided, complementary to the general valuation for solvency purposes (→ paragraph D - introduction).

LIABILITY CLASSES AT FAIR VALUE

For LFL, all liability classes except for Technical Provisions, Contingent liabilities and Deferred tax liabilities, where specific SII valuations apply, have been measured at fair value as follows:

Provisions other than technical provisions

Provisions other than technical provisions for Solvency II purposes are valued in accordance with IAS 37. The valuation under IAS 37 is expected to be a good approximation for the fair value, and the IAS 37 valuation is deemed to be compliant with Solvency II requirements.

Employee/Pension benefit obligations

Pension benefit obligations are valued in accordance with the principles of IAS 19, which are in compliance with the Solvency II requirements. The valuation method adopted is called projected unit credit method and is based on an actuarial approach. The valuation is carried out by an acknowledged external expert.

The amount recognized as a liability represents the net total of the followings:

- the present value of the defined benefit obligation (DBO) at valuation date; minus
- the fair value at the valuation date of plan assets out of which the obligations are to be settled directly.

Furthermore, payables for other long-term employee benefits, such as jubilee benefits, are valued on the expected value of discounted future cash flows, also considering turn-over assumptions, and are recognized as payables in the Solvency II Balance Sheet.

Deposits from reinsurers, Payables and any other liability

All other liability classes, such as deposits from reinsurers, payables or other liabilities have been valued by estimating the amount that would rationally be paid to settle the obligation at the end of the reporting period or to transfer it to a third party at that time, also taking into consideration the business rules for the different types of liabilities. According to these considerations and due to close duration and maturity the SII value is expected to be equal to the IFRS nominal value. For further details please refer to section D.3.3, where specific explanations are given to the different types of payables (→ Payables R0820/R0830/R0840).

LIABILITY CLASSES WITH SOLVENCY II VALUATION SPECIFICITIES

As mentioned above, the Solvency II regulatory framework (Delegated Regulation (EU) 2015/35, Arts. 8 & 11 – 16) requires some exceptions from general Solvency II valuation principles. In particular, these exceptions for liabilities, as far as they are relevant for LFL, refer to:

- Technical provisions (Art. 8 Delegated Regulation (EU) 2015/35)
- Contingent Liabilities (Arts. 11 & 14 Delegated Regulation (EU) 2015/35)
- Deferred tax liabilities (Art. 15 Delegated Regulation (EU) 2015/35)

The valuation of technical provisions has already been disclosed in the previous paragraph D.2. *Technical provisions*.

For Contingent liabilities and Deferred tax liabilities, the following valuation principles have been applied in line with Solvency II requirements:

Contingent liabilities

For the definition of contingent liabilities, Solvency II regulation (Art. 11 of the Delegated Regulation (EU) 2015/35) refers to IAS 37 § 10. In particular, contingent liabilities include present obligations, where the “contingency” implies uncertainty about the amounts and timing.

The recognition criteria for contingent liabilities on the Solvency II balance sheet are determined by the definition in IAS 37 for contingent liabilities. However, other than under IFRS, in case that a contingent liability is material and the possibility of an outflow of resources embodying economic benefits is not remote, the contingent liability has to be recognized on the Solvency II balance sheet.

In accordance with the provisions of Art.11 of Delegated Regulation (EU) 2015/35, contingent liabilities are considered material, if information about the current or potential size, or nature of that liability could influence the decision-making or judgment of the intended user of that information.

In the valuation for solvency purposes in accordance with Art. 14 of Delegated Regulation (EU) 2015/35, the contingent liabilities are valued on the expected value of future cash flows that are required to settle the liability over its lifetime. The estimation is based on an expected present value approach (i.e. a probability-weighted average of the present values of the outflows for the possible outcomes).

For each contingent liability, the possible exposure and the likelihood of these outcomes is considered in the determining the value of the contingent liability.

Deferred tax liabilities (DTL)

Deferred taxes recognized as a liability in the balance sheet follow the same assumptions as deferred taxes recognized as an asset. Consequently, the same consideration as provided in D.1. *Assets* have been applied for liabilities purposes.

DTL is recognized on an item by item basis for those balance sheet items, where the change to SII value is an increase of the value of an asset item, or a decrease of the value of the liability item, e.g. a decrease in technical provisions.

Based on its origin, DTL is the recognition of a tax liability due to future taxable profits, whereby DTL is always recognized to the full amount.

The table “*Comparison of SII and Statutory Balance Sheet / Liabilities*” in section D.3.3. shows an overview of the valuation techniques used for each liability class under the SII valuation framework in comparison to the Statutory accounts valuation and provides qualitative and quantitative information on the differences.

D.3.2. STATUTORY VALUATION

For the statutory account valuation, the generally accepted accounting principles of Liechtenstein (local GAAP) have been applied. For all liability classes belonging to *D.3 Other Liabilities*, the carrying amount according to local GAAP is stated in the Statutory Balance Sheet. According to local GAAP, the carrying amount is the nominal amount of the liability.

The table “*Comparison of SII and Statutory Balance Sheet / Liabilities*” in section D.3.3. shows an overview of the valuation techniques used for each asset class under the local accounting framework in comparison to the valuation under Solvency II and provides qualitative and quantitative information on the differences.

D.3.3. DIFFERENCES BETWEEN SOLVENCY II AND STATUTORY BALANCE SHEET

Differences in values between SII and statutory financial statements are mainly due to the fact that for specific balance sheet items within the statutory balance sheet valuations different from fair value are used. Please refer to previous sections for a description of the SII valuation (→ paragraph D.3.1.) and the statutory valuation (→ paragraph D.3.2.) approach applied for liabilities.

The following table shows the main differences for each class of liability between the figures reported in the SII Balance Sheet and those reported in the Statutory Balance Sheet as at 31.12.2019. All differences result from the different valuation principles applied for the SII resp. for the statutory valuation of the liabilities, as described above. For each class of liability the relevant valuation principles under SII and Statutory Accounts are also indicated in the table and a qualitative explanation for the differences is given after the table.

Comparison of the valuation in Solvency II and Statutory Balance Sheet - Liabilities

Liabilities in TCHF	Ref.	Solvency II (a)		Statutory (b)		Delta (a-b) Change to SII Value YE2019

EXPLANATION OF MAIN DIFFERENCES PER LIABILITY CLASS:**Technical Provisions (R0650/R0690)**

The difference between the SII value and the statutory accounts value of the technical provisions (- 21.2 CHF millions for total technical provisions; YE2018: - 26.9 CHF millions) is due to the different valuation principles for technical provisions under SII and under local GAAP. Under local GAAP, the technical provisions are calculated according to the tariff specifications using a first order basis, whereas the SII values of the technical provisions have to be assessed on a best estimate basis, including a risk margin. For a detailed explanation of the SII valuation of the technical provisions and the differences to the statutory valuation, please refer to section D.2. *Technical Provisions*.

Contingent Liabilities (R0740)

As stated in D.3.1, contingent liabilities for SII purposes are valued according to the principles given by IAS 37 and are recognized in the balance sheet, when material.

For the valuation of the contingent liabilities, the estimated maximum outflow was considered based on the expected present value of future cash-flows required to settle the contingent liabilities over its lifetime. Future Cash-flows were discounted at risk-free rate. Additionally, the likelihood of these outcomes (probability of occurrence) was considered in order to determine the value to be recognized on the SII Balance Sheet. Following this approach, the overall amount to be recognized in the SII Balance sheet at YE2019 has been calculated at TCHF 1'535 (YE2018: TCHF 1'588).

The contingent liabilities are composed of a contingent liability already built in 2017 (TCHF 675), reflecting a possible future risk exposure in some countries with business underwritten under the FPS framework and additional contingent liabilities occurred in the reporting period (TCHF 100) for diligence for FACTA and new contingent liabilities in 2019 for litigation from policyholders (TCH 762).

Due to the uncertainty of occurrence (< 50 %) the contingent liabilities do not qualify as under statutory criteria, resulting in valuation differences of TCHF 1'535.

Provisions other than Technical Provisions (R0750)

For SII purposes, provisions other than technical provisions have been valued according to the principles given by IAS 37. IAS 37 is regulating these types of provisions and it is deemed to be compliant with the SII accounting principles.

The statutory values are recognized according to local GAAP principles. Some of these local GAAP provisions do not qualify as provisions under IAS 37 requirements and are therefore derecognized under SII accounts.

The following table shows the details for this position:

Provisions other than technical provisions	in TCHF			
	SII Value		Statutory value	
	YE2019	YE2019	YE2018	YE2018
Provisions for the currency exchange rate risk	-	2'350	-	2'350
Provisions for legal litigation	1'443	1'443	1'000	1'000
TOTAL other provisions	1'443	3'793	1'000	3'350

Compared to the previous year, the provisions other than technical provisions under Solvency II increased by 0.4 CHF millions (statutory by 0.4 CHF millions) due to a decrease of the provisions for legal litigation. The provisions for legal litigation are based on the best estimate of outflows for pending legal cases.

Pension Benefit Obligations (R0760)

Pension Benefit Obligations under Solvency II are valued in accordance with IAS 19 principles. Since these obligations are not recognized under statutory valuation, valuation differences of TCHF 494 (YE2018: TCHF 379) between SII and statutory accounts occur. IAS 19 valuation results in the following values for YE 2019:

Employee Benefits of LFL are categorized in "Post-employment benefits", which correspond to the position "Pension benefit Obligation" and "Other long-term employee benefits", which are treated as payables.

Employee Benefits	in TCHF	
	YE2019	YE2018
Post-employment benefits (Pension Benefit Obligation; R0760)	493.9	378.7
Other long-term employee benefits (Jubilee Benefits; R0840)	33.8	30.9

For the determination of the economic values of the employee benefits, the following actuarial and economic assumptions were applied:

Principal actuarial and economic assumptions

Beginning of Period	01.01.2019	01.01.2018
End of Period	31.12.2019	31.12.2018
Discount rate (beginning of period)	0.80%	0.60%
Discount rate (end of period)	0.10%	0.80%
Expected return on plan assets (in period)	0.80%	0.60%
Interest on savings-account	0.30%	0.80%
Salary increase rate	1.25%	1.25%
Pension increase rate	0.00%	0.00%
Lump-sum withdrawal rate	10.00%	10.00%
Mortality table	BVG 2015 GT	BVG 2015 GT
Disability table	BVG 2015	BVG 2015
Turnover table	very high	very high
Treatment of contributions from employees	IAS19.93(a)	IAS19.93(a)

As stated in section D.3.1., the amount recognized as a liability represents the net total of the followings:

- the present value of the defined benefit obligation (DBO) at valuation date; minus
- the fair value at the valuation date of plan assets out of which the obligations

Pension Benefit Obligation	in TCHF	
	YE2019	YE2018
Defined Benefit Obligation	1'748.7	1'622.9
Plan Assets	1'254.8	1'244.2
Pension Benefit Obligation	493.9	378.7

The following table shows the details for the defined benefit obligation (DBO):

Movement in the defined benefit obligation (DBO)	in TCHF	
	YE2019	YE2018
DBO at beginning of period	1'622.9	1'525.7
Current service cost	100.0	80.0
Interest cost	13.9	9.3
Contributions by plan participants	50.7	43.1
Actuarial (gain)/loss on demographic assumptions	-	-
Actuarial (gain)/loss on financial assumptions	169.1	-38.5
Experience (gains)/losses	-13.9	8.9
Exchange rate changes	-	-
Benefits paid	-166.7	-
Past service cost and plan settlements	-27.3	-5.7
Business combinations	-	-
DBO at end of period	1'748.7	1'622.9

The plan assets at YE 2019 amount to TCHF 1'254.8 (2018: TCHF 1'244.2). The plan assets are managed by the local independent pension fund foundation and are invested according to the following strategic asset allocation:

Strategic Asset Allocation of Plan Assets

	2019	2018
Cash and cash equivalents	4.0%	4.0%
Equity instruments	25.0%	25.0%
Debt instruments	61.5%	61.5%
Real estate	7.5%	7.5%
Alternative instruments	2.0%	2.0%

Source: <https://www.vorsorgestiftung.li/de/anlagen/anlagestrategien/konservativ>

Deposits from Reinsurers (R0770)

Due to the low materiality no adjustment is made to the value of reinsurance deposits, when changing the accounting scheme from statutory accounts to fair value measurement under Solvency II, since the nominal amount is considered to be a reasonable approximation for the fair value.

Deferred Tax Liabilities (R0780)

For calculating the amount of deferred taxes, any difference between the SII value of assets/liabilities and their related carrying value for tax purposes is considered on an item by item basis. As stated in section D.3., DTL is recognized for balance sheet items, where the change to SII value is an increase of the value of the asset item, or a decrease of the value of the liability item, resulting in a future taxable profit.

The differences are subject to a deferred tax rate of 12.5 %, which corresponds to the expected average local tax rate for LFL. The same tax rate is also applied for the calculation of deferred taxes in the IFRS reporting of LFL for Generali Group purposes, in line with IAS 12 requirements. The expected average tax rate is evaluated by an external tax expert on a yearly basis. Compared to the previous year, the applicable tax rate remained unchanged.

No offsetting is made between Deferred Tax Assets and Deferred Tax Liabilities.

DTL are related to the following SII items:

Deferred tax liabilities related to SII items		in TCHF	
Deferred Tax Liabilities	Change from Statutory to SII Value	DTL	DTL
Tax rate: 12.5 %	YE2019	YE2019	YE2018
DTL on Financial Investments (R0070)	13'453	1'682	1'015
DTL on Insurance provisions (R0650/R0690/R0330)	21'201	2'265	3'368
DTL on Provisions other than technical provisions (R0750)	2'350	294	294
Total gross deferred tax liabilities	37'005	4'626	4'677
Offsetting with deferred tax assets		-	-
Total deferred tax liabilities in SII Balance Sheet	37'005	4'626	4'677

Compared to the previous year, deferred tax liabilities increased due the increase of the valuation differences between Solvency II and Statutory valuation for the Technical Provision. For further details of the valuation of technical provisions, please refer to section D.2. *Technical Provision*.

Insurance & Intermediaries Payables (R0820)

No adjustment is made to the value of Insurance & Intermediaries Payables, when changing the accounting scheme from statutory accounts to fair value measurement under Solvency II, since the nominal amount is considered to be a reasonable approximation for the fair value. Based on the different types of payables within this liability class, different considerations have to be made in order to support this assumption.

The different types of payables within this liability class are shown in the following table, followed by the relevant explanations for the determination of the fair value:

Insurance & Intermediaries payables		in TCHF	
Insurance & Intermediaries payables	YE2019	YE2018	
Premium Deposits	4'230	5'228	
Prepaid Premiums	666	674	
Payables to Policyholders	8147	5'512	
Payables to intermediaries	1'586	1'635	
Total Insurance & Intermediaries payables	14'629	13'048	

“Premium Deposits” are cash deposit accounts hold by the policyholder in order to pay future premiums for the insurance contract. The deposits are subject to interest payment. According to the contractual agreements of the premium deposit accounts, the amount of prepaid premiums in the deposit cannot exceed the amount of total future outstanding premiums for the policy to be paid-up. The interests to be paid on the premium deposit accounts are based on market interest rates and, according to the business rules, can be adjusted at any time at the discretion of the undertaking. Interest rates are reviewed regularly, at least on a quarterly basis, or whenever deemed necessary. For these reasons, the cash value of the premium deposit account is considered to be a reasonable approximation for the fair value, and no adjustment is made when changing the accounting scheme from nominal value under statutory accounts to fair value measurement under Solvency II.

For all other types of payables no relevant change to SII value is expected when moving from statutory to SII accounts due to close duration and maturity and to the absence of expected interest cash-flows. As a general assumption, the nominal amount is considered to be a reasonable approximation of the fair value and no adjustment is made.

Compared to previous year, the Insurance & Intermediaries payables tend to decrease due to the run-off of the portfolio.

Reinsurance Payables and other payables (R0830, R0840)

Reinsurance payables and most other non-insurance payables, such as tax payables, social security payables, or intercompany current accounts are carried at the original invoiced amount (nominal amount), which is considered to be a reasonable approximation of the fair value due to the short-term nature. Therefore, and due to the absence of interest cash-flows, no adjustment is made when moving from nominal value in statutory accounts to fair value in SII accounts.

Payables for other long-term employee benefits (e.g. jubilee benefits), which are also shown in this position, are valued according to IAS 19 principles (expected discounted cash flows, also considering turn-over assumptions), resulting in a valuation difference of TCHF 34 at YE2019 (YE2018: TCHF 31) compared to statutory accounts. For economic assumptions applied, please refer to the explanation given above for the position Pension Benefit Obligations (R0760).

Any other liabilities not elsewhere shown (R0880)

This residual class of liability items mainly includes accruals. Based on the low materiality and due to the short term nature of these liabilities as well as the absence of expected interest cash-flows, no adjustment is made when moving from nominal value in statutory accounts to fair value in SII accounts.

D.4. ALTERNATIVE METHODS FOR VALUATION

SII valuation of all asset and liability classes is in line with the solvency II valuation framework and no alternative methods have been applied.

D.5. ANY OTHER INFORMATION

There is no other material information regarding the valuation of assets and liabilities for solvency purposes to be reported for LFL.

Annex D - Public QRTs YE2019**Balance sheet – Assets (Template S.02.01)**

E. Capital Management

E.1. OWN FUNDS

E.1.1. POLICIES AND PROCESSES RELATED TO OWN FUNDS MANAGEMENT

The Capital Management Group Policy defines principles for Capital Management activities to which the Assicurazioni Generali S.p.A. and the Group Legal Entities in scope must adhere.

The objective of the Capital Management Group Policy is to provide the entities in scope with a framework designed to:

- classify and periodically review Own Funds in order to guarantee that Own Funds items meet the requirements of the applicable capital regime both at issuance and subsequently;
- regulate issuance of Own Funds according to the medium-term Capital Management Plan and Strategic Plan also to guarantee that Own Funds are not encumbered, that all actions required or permitted related to the governance of the Own Funds are timely completed, that ancillary Own Funds are timely called, that terms and conditions are clear and unambiguous, including instances in which distributions on an Own Funds item are expected to be deferred or cancelled;
- ensure that any policy or statement in respect of ordinary share dividends is taken into account when analyzing the capital position;
- establish driving principles and common standards to carry out these activities efficiently, in compliance with the relevant regulatory requirements and legislative frameworks at Group and Local level, and in line with the stated risk appetite and strategy of the Generali Group.

The Capital Management Group Policy has been approved by the BoD of LFL.

The Capital Management Plan (CMP) represents a part of the overall three-year Strategic Plan and ensures the consistency of the CMP with the three-year Strategic Plan assumptions, which include inter alia:

- financial scenarios;
- strategic asset allocation;
- business mix.

The CMP includes a detailed description of the development of Own Funds and Regulatory Solvency Ratio from the latest available actual figures to the last plan year figures.

In case the three year Strategic Plan needs to be resubmitted to GHO due to a significant variation of Own Funds or SCR also the CMP has to be updated accordingly.

Local CFOs are responsible to produce local CMP and local CEOs are responsible to submit them to the relevant BoD for approval. Furthermore, local Entities include the CMP in the information package to be delivered to the GHO in the planning process. The main elements of the CMP are reviewed and monitored by the GHO.

If extraordinary operations (i.e. M&A, Own Funds issuance) are foreseen in the plan period, their impact is explicitly included in the Own Funds and Regulatory Solvency Ratio development and further details are included in the relevant documentation. Own Funds issuances are explicitly included in the CMP with a detailed description of the rationale.

The description of the development of Own Funds explicitly includes the issuance, redemption or repayment (earlier or at maturity) of Own Funds items and their impacts on the limits on tiers. Any variation in the valuation of Own Funds items is also indicated, with additional qualitative details in terms of limits on tiers when needed.

The CMP is defined taking into account limits and tolerances set in the Risk Appetite Framework.

In the CMP any transitional measure has to be reported in terms of impact on the solvency position current and at the end of the transitional period (both at Group and Local level), duration and general features including their absorption capacity in times of stress.

Along with the Capital Management Plan, a Capital Management Report is produced once a year providing amongst others, a detailed analysis of the changes to the Own Funds and to the Solvency Ratio between different reporting periods.

E.1.2. AMOUNT AND QUALITY OF ELIGIBLE OWN FUNDS

ELIGIBLE OWN FUNDS TO MEET SCR AND MCR

LFL's eligible own funds are all categorized as Tier 1 – unrestricted and amount to 89.9 CHF millions (YE2018: 64.7 CHF millions) to cover the SCR of 56.9 CHF millions (YE2018: 54.3 CHF millions) and the MCR of 14.2 CHF millions (YE2018: 13.6 CHF millions).

Solvency Ratio – SCR coverage

(CHF millions)	YE2019	YE2018	Change
Eligible Own Funds	89.9	64.7	25.2
Solvency Capital Requirement	56.9	54.3	2.6
SCR Coverage	158.2%	119.1%	39.1pp

Solvency Ratio - MCR Coverage

(CHF millions)	YE2019	YE2018	Change
Eligible Own Funds	89.9	64.7	25.2
Minimum Capital Requirement	14.2	13.6	0.6
MCR Coverage	633.3%	476.5%	156.8 pp

Explanations for significant changes between YE2018 and YE2019 can be found below.

Eligible Own Funds are calculated based on the following components (for the full tables of the public QRT (template S. 23.01) please refer to the Annex E at the end of this chapter.):

*BASIC OWN FUNDS***Own funds**

(CHF millions)	Tier 1 YE2019	Tier 1 YE2018	Change
Ordinary share capital (gross of own shares)	10.0	10.0	-
Share premium account related to ordinary share capital	-	-	-
Surplus funds	-	-	-
Preference shares	-	-	-
Share premium account related to preference shares	-	-	-
Reconciliation reserve (see below table)	79.9	54.7	25.2
Subordinated liabilities	-	-	-
An amount equal to the value of net deferred tax assets	-	-	-
Other own fund items approved by the supervisory authority as basic own funds not specified above	-	-	-
Deductions for participations in financial and credit institutions	-	-	-
Total basic own funds after deductions	89.9	64.7	25.2

As at YE2019, total basic own funds amount to 89.9 CHF millions (YE2018: 64.7 CHF millions) including 10.0 CHF millions (YE2018: 10.0 CHF millions) ordinary share capital and 79.9 CHF millions (YE2018: 54.7 CHF millions) reconciliation reserve (see details below). In its own funds, LFL does not hold any financial subordinated liabilities or any other own funds items. There are no items to be deducted from basic own funds.

There has been no issuance or redemption of own funds during 2019

The main reasons for the increase in own funds value are two capital reserve strengthening in 2019 in the total amount of CHF 37 million and well-performing equity markets. On the other hand, the interest rate trend was negative. Overall the own funds increased by CHF 25.2 million.

RECONCILIATION RESERVE AND EPIFP

In the following table, the reconciliation reserve is determined starting from excess of assets over liabilities in the Solvency II Balance Sheet:

Reconciliation reserve

(CHF millions)	YE2019	YE2018	Change
Assets – Liabilities (from Annex D)	89.9	64.7	25.2
Own shares	-	-	-
Foreseeable dividends and distributions	-	-	-
Other basic own fund items	10.0	10.0	-
Restricted own fund items due to ring fencing	-	-	-
Reconciliation Reserve	79.9	54.7	25.2

The only element to be deducted from the Solvency II excess of assets over liabilities for obtaining the reconciliation reserve is the ordinary share capital in the amount of 10.0 CHF millions (YE2018: 10.0 CHF millions). No ordinary dividends are foreseen to be paid in 2020 for business year 2019, the same as in 2019.

The EPIFP is a significant component of the excess of assets over liabilities under Solvency II. The following table shows the EPIFP at reporting date.

Expected Profits in Future Premiums (EPIFP)

(CHF millions)	YE2019	YE2018	Change
EPIFP - Life Business	19.3	26.0	-6.7

RESTRICTIONS TO OWN FUNDS

As per YE2019, there is no restriction applicable to LFL's own funds, corresponding to YE2018.

ANCILLARY OWN-FUND

As per YE2019, there are no ancillary own-funds present, corresponding to YE2018.

RECONCILIATION BETWEEN STATUTORY SHAREHOLDER FUNDS AND OWN FUNDS FOR SOLVENCY PURPOSES**Reconciliation between Statutory Equity and Excess of Assets over Liabilities**

(CHF millions)	YE2019
Statutory Equity	60.0
Statutory Capital reserves and other reserves	48.0
Of which:	
Share capital	10.0
Capital reserves	38.0
Other equity instruments	-
Reserve for currency translation differences	-
Own shares	-
Statutory Revenue reserves	12.0
Of which	
Revenue reserves	22.8
Reserve for unrealized gains & losses on AFS financial assets	-
Reserve for other unrealized gains and losses through equity	-
Result of the period	-10.7
Adjustment on Intangible	0.0
Adjustment on Investment	13.5
Adjustment on Net Technical Provision	20.5
Adjustment on Financial and Subordinated debt	-
Adjustment on Other Items	0.3
Adjustment on Deferred Taxes	-4.3
Excess of Assets over Liabilities	89.9

The difference between statutory equity and Excess of Assets over Liabilities under Solvency II is mainly explained by the market value adjustments made on investments and technical provisions following the application of Solvency II principles. For details on the differences between Solvency II and statutory valuation, please refer to chapter D.

E.2. SOLVENCY CAPITAL REQUIREMENT AND MINIMUM CAPITAL REQUIREMENT

E.2.1. SCR AND MCR VALUES

For the calculation of the Solvency Capital Requirements and the Minimum Capital requirements LFL applies the Standard Formula approach, following the process described in the Directive 2009/138/EC and the Delegated Regulation (EU) 2015/35, as defined by EIOPA.

The main results are summarized as follows (for the full tables of the public QRTs (templates S. 25.01 and S.28.01) please refer to the Annex E at the end of this chapter):

SCR Value

(CHF millions)	YE2019	YE2018	Change
Solvency Capital Requirement	56.9	54.3	2.6

The SCR calculation is based on Standard Formula for YE2019 corresponding to YE2018.

There are no regulatory capital add-ons and no simplified calculations of SCR were used for YE2019 corresponding to YE2018.

As LFL has no non-life or health business no undertaking specific parameters were used for YE2019 corresponding to YE2019.

Explanations for significant changes between YE2018 and YE2019 can be found below.

MCR Value

(CHF millions)	YE2019	YE2018	Change
Minimum Capital Requirement	14.2	13.6	0.6

MCR is calculated based on the following inputs:

Input MCR calculation

(CHF millions)	YE2019	YE2018	Change
BEL - Insurance with profit participation minimum guarantee component	130.8	126.0	4.8
BEL - Insurance with profit participation Future Discretionary benefits	0.7	1.7	-1.0
BEL - unit-linked contracts	517.7	453.5	64.1
Capital at Risk	369.7	415.8	-46.1
SCR	56.9	54.3	2.5

The relevant MCR constraint is the MCR floor and as the SCR has not changed significantly compared to the previous year, consequently the MCR remained almost on the same level.

E.2.2. SCR BREAKDOWN**Total SCR YE2019 split by Risk before and after diversification**

(CHF million)	Before Diversification		After Diversification	
	Total	Impact (%)	Total	Impact (%)
nSCR before Diversification	98.5	100%		
Market Risks	54.6	55%	40.4	52%
Counterparty Default Risks	4.7	5%	4.6	6%
Life Underwriting Risks	39.3	40%	33.2	42%
Health Underwriting Risks	0.0	0%	0.0	0%
Non-Life Underwriting Risks	0.0	0%	0.0	0%
Intangible	0.0	0%	0.0	0%
Diversification benefit	-38.6		-18.2	
nBSCR after Diversification	60.0			
Operational Risk	1.3			
Notional SCR arising from RFF	0.0			
Total SCR before Taxes	61.3			
Tax absorption	-4.4			
Total SCR	56.9			

Total SCR YE2018 split by Risk before and after diversification

(CHF millions)	Before Diversification		After Diversification	
	Total	Impact (%)	Total	Impact (%)
nSCR before Diversification	93.3	100%		
Market Risks	50.6	54%	38.1	51%
Counterparty Default Risks	1.9	2%	1.8	3%
Life Underwriting Risks	40.8	44%	34.4	46%
Health Underwriting Risks	0.0	0%	0.0	0%
Non-Life Underwriting Risks	0.0	0%	0.0	0%
Intangible	0.0	0%	0.0	0%
Diversification benefit	-35.4		-16.4	
nBSCR after Diversification	57.9			
Operational Risk	1.8			
Notional SCR arising from RFF	0.0			
Total SCR before Taxes	59.7			
Tax absorption	-5.4			
Total SCR	54.3			

The total SCR is slightly higher than in the previous year. Market Risks raised mainly due to higher currency risk. The slight decrease of Underwriting Risks is mainly due to the decrease of expense risk following lower expenses.

E.3. USE OF THE DURATION-BASED EQUITY RISK SUB-MODULE IN THE CALCULATION OF THE SOLVENCY CAPITAL REQUIREMENT

LFL does not use the duration-based equity risk sub-module in the calculation of the SCR.

E.4. DIFFERENCES BETWEEN THE STANDARD FORMULA AND ANY INTERNAL MODEL USED

This section is not applicable for LFL, since only Standard Formula is applied for SCR calculation

E.5. NON-COMPLIANCE WITH THE MINIMUM CAPITAL REQUIREMENT AND NON-COMPLIANCE WITH THE SOLVENCY CAPITAL REQUIREMENT

There is no non-compliance to be reported by LFL for YE2019. MCR and SCR results as well as the coverage ratios by eligible own funds are fully compliant with the Solvency II requirements.

E.6. ANY OTHER INFORMATION

Stress tests and sensitivities for different scenarios have been performed with regard to the sensitivity of the Solvency Ratio. For a description of methods and assumptions used in this analysis as well as for the results, please refer to section C.7.

There is no other material information regarding the capital management to be reported for LFL.

Annex E - Public QRTs YE2019**Impact of long term guarantees measures and transitional****(Template S.22.01)**
